

Adult Coho Salmon Returning to Carnation Creek: 1971 – 2006

Chum and coho salmon have responded differently to forest harvesting. Chum salmon populations have exhibited the most marked changes even though this species uses freshwater habitats much less extensively than coho salmon.

Adult Chum Salmon Returning to Carnation Creek: 1970 – 2006

Mean numbers of chum spawners returning to the creek have fallen 3.3 fold from pre-harvest levels. Numbers of adult coho (excluding precocious young males called jacks) returning to spawn have also declined during the post-harvest period.
