

# Cushion Fleabane (*Erigeron poliospermus* var. *poliospermus*) Asteraceae (Sunflower Family)

Status: Blue / Not Assessed Best Survey Time: May to Jun

General Habitat: Upland

### **RANGE**

- Found in North America from Oregon, Washington and Idaho (USA), reaching the northern extent of its range in southern British Columbia
- In B.C., known from numerous sites west of Osoyoos and Oliver

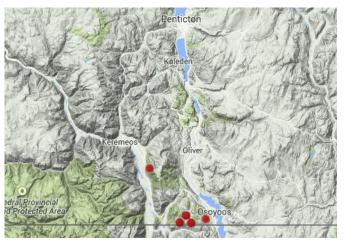

Figure 1 B.C. distribution of *Erigeron poliospermus* var. poliospermus (modified from BC CDC 2014)

#### **HABITAT**

- Tops of rocky knolls and outcrops in sagebrush steppe in the Interior Douglas fir, Ponderosa Pine and Bunchgrass Biogeoclimatic Zones
- Associates include compact selaginella (Selaginella densa), bitterroot (Lewisia rediviva), bluebunch wheatgrass (Pseudoroegneria spicata), brittle prickly-pear cactus (Opuntia fragilis), shaggy fleabane (Erigeron pumilus), prairie sagewort (Artemisia frigida) and sagebrush (A. tridentata)

Figure 3 Close-up of habitat at top of rocky knoll with abundant exposed rock, Selaginella densa and Artemisia frigida

### LIFE HISTORY

- Tufted perennial flowering in May and early June, usually when bitterroot is flowering
- The achenes mature in early to mid-summer, and are plumed, perhaps aiding with dispersal
- Plants die back in the fall and overwinter below ground as persistent caudices (short, persistent stems below the surface)

**Figure 4** Illustration of *Erigeron poliospermus* var. *poliospermus* by Elizabeth Stephen (Douglas et al. 1998)

# Erigeron poliospermus var. poliospermus (continued)

### **DESCRIPTION**

#### General

- Taprooted perennial herb with a branching caudex (short, persistent stem below the surface)
- Erect or curved stems, 10 to 30 cm tall, covered with stiff hairs and glands

#### Leaves

- Mostly basal, narrowly oblanceolate, covered in hairs and glands, 2 to 8 cm long, and <1 cm wide</li>
- Stem leaves few, mostly linear, reduced in size upwards

### **Flowers**

- Heads with ray and disk flowers, involucral bracts 5 to 9 mm tall, stiff hairy and glandular
- Ray flowers 20 to 45 in number, white to purple, 5 to 14 mm long, 1.3 to 3.6 mm wide

#### <u>Fruits</u>

- 2-nerved achenes, covered in dense, appressed hairs
- Pappus with an inner series of 20 to 30 firm bristles and an outer series of short scales

**Figure 5** Typical plant showing mostly basal, hairy leaves and wide purple ray flowers on erect heads

#### **IDENTIFICATION TIPS**

- Often occurs in the same habitat as shaggy fleabane (Erigeron pumilus), which has more abundant stem leaves and narrower (0.7 to 1.5 mm), more numerous (50 to 100) white ray flowers
- Tufted fleabane (*Erigeron caespitosus*) looks similar but has stem leaves that are distinctly broader nearer the base than the tips, shorter hairs throughout, and often branching stems; it is a calciphile, preferring high-pH soils, while cushion fleabane occurs on soils derived from acidic rock

# GENERAL THREATS AND GUIDANCE

- Avoid development in areas with known occurrences of Erigeron poliospermus var. poliospermus through project relocation or redesign
- Protect upland habitats from disturbance and development, including excessive grazing pressure from cattle
- Follow provincial methods for when and how to conduct plant species at risk surveys
- Follow provincial policy and guidance on how to avoid, minimize, restore and offset impacts to plant species at risk and their habitats
- Report any sightings to the B.C. Conservation Data Centre (<u>cdcdata@gov.bc.ca</u>) and FLNR Ecosystems Section (josie.symonds@gov.bc.ca)
