MANAGEMENT SUMMARY

This report presents the results of a cultural heritage resource overview of Checleset Bay and outer Kyuquot Sound. The overview was conducted by **Arcas** Consulting Archeologists Ltd (**Arcas** Ltd) and **Archeo** Tech Associates, on behalf of the Kyuquot First Nation and BC Parks.

The study area is located on the northwest coast of Vancouver Island, approximately 30 km south of Port Alice. **Specifically**, the study area included the outer coastline (from high tide mark to **500** m inland) of Vancouver Island and all associated islands, islets and intertidal areas from Rugged Point to Cape Cook.

The objectives of the overview were to produce a statement of archaeological resource distribution and potential within the study area; draft archaeological resource maps of the study area indicating the locations of all previously recorded archaeological sites, and ethnographically documented traditional use sites; assess and map areas of moderate to high archaeological resource potential within the northern portion of the study area (i.e., Checleset Ray); generate a database containing information on **all** recorded archaeological sites, ethnographically documented traditional use sites, and assessed archaeological resource potential **within** the study area; provide a preliminary assessment of potential impacts to archaeological sites due to use and management of the study area; and provide recommendations concerning the need for further archaeological inventory or impact assessment studies.

Our review of the archaeological, historical, and ethnographical literature indicates that at least 79 archaeological sites and 93 traditional use locations or place names are present in the study area. It is likely that these represent only a **small** percentage of the cultural heritage resources actually present in the study area.

Further research should involve extensive work with Chickliset and Kyuquot elders to identify all aboriginal places in the study area and to develop a context so that the places can be understood in terms of **Chickliset** and Kyuquot history and land use. This research should involve field visits with cultural advisors to traditional use sites, named places and archaeological sites. The research should include archaeological site survey and evaluative testing which will record physical evidence of aboriginal occupation and use of these places.

Specifically, we recommend that:

- (1) Mapping of archaeological site potential be completed for the southern portion of the study area. Assessment of archaeological potential was limited to the Checleset Bay portion of the study area, due to budget constraints. This mapping should be completed for the southern portion (outer Kyuquot Sound) of the study area in order to facilitate the management recommendations presented below.

- (2) A more thorough inventory of place names, traditional use sites and archaeological resources within the study area be conducted. This is clearly a immense task, however it is essential to effective monitoring and prevention of adverse impacts to heritage resources. To facilitate this study, areas within the study area should be prioritized according to intensity of use and probability of future development (i.e., those areas which are likely to **be** used most intensively should be examined first).
- (3) Attempts be made, through the watchman program, to monitor and protect **the** integrity of documented archaeological sites in the study area. Sites containing human remains are particularly susceptible to vandalism and thus should be monitored most closely. Specifically these include sites **DlSt-1; EaSu-1, 15, 16; EaSv-5, 6, 7, 8, 11, 21, 24, 25, 26, 28;** and **EaSw-2, 3,** and 4. If considered appropriate, signs may be posted near these sites to inform visitors of their significance and the (physical and legal) consequences of their intentional alteration, damage or destruction.
- (4) Detailed archaeological impact assessments be conducted for any areas which are specifically scheduled for development, **with** exception of developments in low potential locations. It is essential that such studies be undertaken well in advance of development so that time required to formulate and implement mitigative measures, if necessary, is available.

1.0 INTRODUCTION

BC Parks and the Kyuquot First Nation are developing a heritage resource watchman program for the Checleset Bay and outer Kyuquot Sound area. In order for such a program to be effective a thorough inventory of archaeological **resources** and traditional use locations in the area is required. This report summarizes **the** results of the first phase of the inventory process: a cultural heritage resource overview of the study area. This overview was conducted by **Arcas Consulting Archeologists Ltd (Arcas Ltd)** and **Archeo Tech Associates**, on behalf of the Kyuquot First Nation and BC Parks. It has been prepared in accordance with the project proposal prepared by **Arcas Ltd** (dated March 6, 1995), and the guidelines for an Overview Assessment in **the British Columbia Archaeological Impact Assessment Guidelines** (Apland and Kenny 1992), issued by the Archaeology Branch, Ministry of Small Business, Tourism, and Culture.

1.1 Study Area and Objectives

The study area is located on the northwest coast of Vancouver Island, approximately 30 km **south** of Port Alice. Specifically, the study area included the outer coastline (from high tide mark to 500 m inland) of Vancouver Island and all associated islands, islets and intertidal areas from Rugged Point to Cape Cook (see Figure 1).

The objectives of the overview were to:

- (1) produce a statement of **archaeological** resource distribution and potential within the study **area**;
 - (2) draft archaeological resource maps of the study area indicating the locations of all previously recorded archaeological sites, and ethnographically documented traditional use sites;
 - (3) assess and map areas of moderate to high archaeological resource potential within the northern portion of the study area (i.e., Checleset Bay);
 - (4) generate a database containing information on all recorded archaeological sites, ethnographically documented traditional use sites, and assessed archaeological resource potential within the study area;
 - (5) provide a preliminary assessment of potential impacts to archaeological sites due to use and management of the study area; and
 - (6) provide recommendations concerning the need for further archaeological inventory or impact assessment studies.
-

2.0 METHODOLOGY

The overview involved:

- (1) background library and records search of ethnographic, archaeological and historical records pertaining to the study area;
- (2) consultations **with** individuals and organizations with knowledge of the heritage resources in the study area, including contact with representatives of the Chickliset and Kyuquot Tribes.
- (3) examination of biophysical and topographic mapping and aerial photographs to assess archaeological resource potential throughout the study area.

2.1 Background Research

Background research for the overview included a review of all pertinent records and archival materials among the library holdings of **Arcas** Consulting Archeologists Ltd and **Archeo** Tech Associates. These included copies of numerous publications, professional reports, and archival/archaeological records from the Archaeology Branch (Ministry of Small Business, Tourism and Culture), Kyuquot First Nation, British Columbia Archives and Records Service, Royal British Columbia Museum (Human History Division), and **Sofor** Infographics Ltd. Specific information regarding known archaeological sites in the study area was obtained from the Canadian Heritage Information Network (CHIN).

2.2 Consultation

Consultation with local First Nations representatives included telephone discussions, written correspondence and in-person interviews. This was conducted by Amoud Stryd of **Arcas** Ltd and John Dewhirst of Archeo Tech Associates between March 24 and April 15, 1995.

2.3 Resource Potential Assessment

Assessment of archaeological resource potential was based on consideration of the locations and distributions of previously recorded sites, ethnographic and historic references, as well as topographical and **biophysical** characteristics. The potential assessment was largely based on the **pretence** that archaeological site locations are often correlated **with** certain microenvironmental characteristics, and **thus** the absence and presence of these variables can be used to predict the likelihood of sites. Some of the variables which were considered include ground surface **slope**, proximity to potable water and aquatic resources, shelter from prevailing

winds, drainage quality, local wildlife values, view of surrounding terrain, aspect (i.e., solar exposure based on valley side and direction of slope), and vegetation/forest cover.

2.4 Mapping

The maps which accompany this report display three types of information: recorded archaeological sites, known traditional use locations, and areas of archaeological resource potential. All recorded archaeological sites in the study area have been plotted as accurately as existing documentation would allow. Each site is indicated by a triangle and is **labelled** with a site number (e.g., **EaSx-1**). Detailed information about individual archaeological sites is contained in Appendix A and a dbase format electronic database. Similarly, known traditional use sites are indicated by a dot and a number which is linked to information in Appendix B and the database.

The study area has also been divided into numerous "Archaeological Resource Polygons" based on **assessed** potential for archaeological resources. Areas displaying moderate to high potential for specific archaeological resources have been identified, plotted and **labelled** with a polygon number followed by archaeological resource potential codes (see map Key). Detailed information about each polygon is contained in the accompanying database.

For the purposes of this study archaeological resources have been grouped into six general categories. These categories are: burials, habitation remains, intertidal features, rock art, culturally **modified** trees, and Euro-Canadian historic features. These resource types generally encompass all of the possible archaeological resources likely to be found in the study area. They are defined as follows:

- (1) Burials -- this category includes material remains and features typically associated with mortuary practices. These include human skeletal remains, burial boxes, burial poles/trees and grave goods.
 - (2) Habitation Remains -- this category includes material remains and features typically associated with short term to semi-permanent habitation. These generally include the dense artifact and faunal remains concentrations which form shell **middens**, and features such as house **platforms**, storage pits, post holes, fortifications, house poles and cooking hearths.
 - (3) Intertidal Features -- this category includes features typically associated with human activities in intertidal areas as well as waterlogged portions of habitation sites. Features commonly found in intertidal waters include stone fish traps, stone canoe runs and wooden fish weirs. Waterlogged habitation sites or "wetsites" are also included in this category. Portions of habitation sites occasionally become waterlogged due to sea level or drainage pattern changes. Such conditions can allow for the preservation of materials
-

such as wood and other plant remains not often found at habitation sites.

- (4) **Rock Art** -- this category includes relatively immobile pictographs (rock paintings) and **petroglyphs** (carved/pecked stone) typically found on bedrock outcrops or large boulders, either inland or along ocean, creek, or lake shorelines.
- (5) **Culturally Modified Trees** -- this category includes standing trees, logs, and stumps which display evidence of aboriginal use. These range from standing trees which have had bark strips removed from them to discarded logs and debris resulting from canoe manufacturing.
- (6) **Euro-Canadian Historic Features** -- this category includes features and other cultural materials associated with historical Euro-Canadian use and/or occupation of the study area. Such features may include remains left behind by early historic logging or mining operations, associated habitations or historic shipwrecks.

It is important **to** note the distinction between archaeological resources and archaeological sites. In this study archaeological resources refer to particular types of features and material remains associated with particular cultural activities. Archaeological sites may be composed of a variety of **these** resources. For instance, a village site may **contain** human burials, **intertidal features** and culturally modified trees as well as having features commonly **associated** with habitation.

3.0 OVERVIEW RESULTS

3.1 Ethnography

The study area lies within the traditional territories of the two most northern **Nuu-chah-nulth** tribes, the Chickliset and the Kyuquot. These tribes became two separate Indian Bands known by the same names and each band had its own Indian Reserves throughout the study area. In ca. 1951 the Chickliset Band officially amalgamated with the Kyuquot Band, and the amalgamated band continued to be known as the Kyuquot Band. At about this time, the Chickliset reestablished themselves on Indian Reserves near Kyuquot (Walter's Cove). Since the relocation, none of the Chickliset Indian Reserves have been permanently inhabited. However, both tribes have remained extant as social groups, each with its own hereditary chiefs, traditional places and tribal territories.

The **Č'iig̱is?ath¹**, anglicised as Chickliset, are a tribe whose traditional territory along the coast extended from Cape Cook southward to the beach opposite Thomas (formerly known as Whiteface) Island (Drucker 1951:222, Map 2; Kenyon 1980:44). However, some Chickliset in the early 1970s stated that Chickliset traditional territory extended farther south, to Lookout Island (Kenyon 1980:44). Some Chickliset alive in the early 1970s remembered wintering on the north side of Cape Cook, where they trapped and hunted (Kenyon 1980:44). The Chickliset were also closely linked to their **Klaskino** Kwagulth neighbours on the north side of the Brooks Peninsula.

The literature contains relatively little information on the Chickliset, and the summary here needs to be checked through further work with Chickliset cultural advisors. The Chickliset tribe consisted of several named local groups who wintered together at the village of Acous. In late historic times, the groups shared a spring and summer village at **Upsowis**, formerly the modern permanent village of the Chickliset (Drucker 1951:222).

The Chickliset groups and their villages and fishing stations are not entirely clear from the literature. It was not until the 20th century that the names of Chickliset groups were recorded. By then, the number of groups probably had declined from population reduction by disease and warfare that intensified with prolonged European contact, beginning in the late 18th century. In the early 1970s, some Chickliset identified three groups: **Malksopaht**, **Ahksaht**, and an unidentified group from the north side of Cape Cook (Kenyon 1980:44). This last group may have been a group known historically as the **Classet**, who spoke both Nootka and Kwakwaka, but of whom little is known. They are thought to have held territory on Cape Cook and in Brooks Bay, and were perhaps absorbed into the Chickliset before 1900 (Ingles 1990:16-

¹ **Nuu-chah-nulth** names in bold face are written here in the **T'aat'aaqsapa** orthography developed by the **Nuu-chah-nulth** Tribal Council. See Jay Powell (editor), *Our World--Our Ways: T'aat'aaqsapa Cultural Dictionary*. **Nuu-chah-nulth** Tribal Council, Port Alberni, 1991. Other native names are either anglicizations or renderings in other orthographies. No attempt here has been made to standardize them.

17). The late Kyuquot elder, Willy Harry, named four Chickliset groups, each with its own chief, village(s), and fishing stations (Louie 1987; Inglis 1990:12). The Chickliset, from whom the tribe apparently took its name, had the village of **Checkaklis** in the **Bunsby** Islands. The Maqtsupiaht village was Upsowis; the Ahkosaht village was Acous. A fourth group, the **Uwa'sa'aht** (?uwa'sa'ath), had the village of "Naspat" or "**Naspahtee**" in Columbia Cove (Louie 1987; Inglis 1990:12).

In addition, a number of Chickliset fishing stations have been recorded: **Hub-toul**, **Mahope**, **Hisnit**, Ououkinsh, Wachts-pa-home, and Quineex, U'was, **Tlitslihwakt**, Naspat, and **A'aitl** (see Drucker 1951:222; RCIA 1914; Inglis n.d.). The locations of several of these places are not precisely known and as list of Chickliset places, it is incomplete. Further work with **Chickliset** cultural advisors is required to provide a more accurate and complete land inventory.

The **Qaay'uuk'ath**, anglicised as Kyuquot, are a tribe whose coastal traditional territory extends from the beach opposite Thomas Island to Rugged Point, and includes the offshore waters west of a line between Rugged Point and Grassy Island (Drucker 1951:224). The dentalia fisheries in this area seem to have been 'shared historically by the Kyuquot and their southern neighbours, the Ehattesah (see Drucker 1951:Map 3).

The Kyuquot consisted of four tribes composed of 14 local groups, each named after its salmon stream (see Drucker 1951:222-225). The four tribes are the **šawisp'ath** of **Kashutl** Inlet; the **qanuupittakam'ath** of Tahsish Inlet; the **q'ixqu'ath** of Amai Inlet; and the **ʔa'a'ath** of the outside coast. Through the **potlatch** system, the chiefs of all the local groups were ranked into a single graded series. All four tribes shared a common summer village at Aktis, where each group owned one or more named house sites (Drucker 1951:223).

Only the territory of the **ʔa'a'ath** tribe is within the study area. Their traditional winter village was **Houpsitas** (Ho:p'sit'a:s). Aktis, on Village Island, was an origin village of one of the local groups of the **q'ixqu'ath** (Drucker 1951:223). Other key sites in the study area are Yakats, important for its nearby salmon stream, and **Kūtsū**, a village site of the **kuutsuu'ath**, one of the local groups belonging to the **ʔa'a'ath**.

A large number of place names have been recorded for the Kyuquot part of the study area by Griggs and Hamilton (1990), but without available historical land use notes on these places.

3.2 Previous Archaeology

The first formal archaeological investigations in the study area were conducted in 1981 by James Haggarty and Richard Inglis of the B.C. Provincial Museum (Haggarty and Inglis 1983). Their investigations were part of the "Brooks Peninsula Refugium Project" which consisted of a multidisciplinary study of Brooks Peninsula; an area believed to have been spared

from ice cover during the last “ice-age”. As part of this study a judgemental shoreline survey of the Brooks Peninsula was conducted. Haggarty and Inglis returned to the area in 1983 and 1984 and continued this survey southward to Kyuquot Channel. Though many sites were recorded during these two surveys it should be kept in mind that they were primarily designed as a preliminary reconnaissance of the area and should not be considered a thorough inventory. Haggarty and Inglis were particularly interested in locating defensive (or refuge) sites. Thus they were primarily concerned with identification of specific habitation sites, no attempt was made to locate other archaeological resource types such as rock art, intertidal features, human burials and culturally modified trees. It is likely that many existing sites were not identified during these studies.

Less extensive archaeological investigations have been subsequently conducted in the area by Rousseau and Howe (1987), who investigated areas adjacent to the Mahope River and Battle Bay, and Grant Keddie (1988) who conducted a judgmental survey of Senecio Ridge on Brooks Peninsula. Most recently, the Underwater Archaeological Society of British Columbia (UASBC 1994) recorded the Thomas A. Foster Shipwreck off Clerke Point.

Collectively, these four studies have resulted in the identification and recording of 79 archaeological sites in the study area. The types of archaeological resources represented by these sites are presented in Table 1 (below). Habitation remains are by far most common being represented at 52 sites. Burials are also fairly common having been observed at 17 sites. 11 sites are reported to contain intertidal features and 2 sites are reported to contain CMTs. It is notable that no sites containing rock art have been recorded in the study area, however, this is not unexpected since rock art is relatively uncommon on the northwest coast of Vancouver Island in general.

3.3 Potential Archaeological Resources

The previous archaeological investigations conducted within the study area provide substantial information on which to base archaeological resource potential assessments. Overall the islands and intertidal areas within the study area display considerable potential for archaeological sites. It is likely that the 79 sites identified represent only a small fraction of the total number of sites in the area.

As is apparent on the archaeological resource maps, significant portions of the study area displays moderate to high potential for some type of archaeological resource. Few areas could be considered to have low resource potential. These largely include small, rocky, unsheltered islands and inland areas which have been recently and intensively logged.

Table 1. Archaeological resource types represented at previously recorded sites in the study area.

Resource Type	Sub-Type	n*
Burials	Cave/Crevice	11
	Cemetery (historic)	2
	Other (surface, midden, canoe)	4
Habitation Remains	Village	34
	Refuge	10

	Fish Weir	3
	Canoe Run	1
Culturally Modified Trees (CMTs)	Bark Stripped Tree	2
Euro-Canadian Historic	Shipwreck	1
* Number of sites containing indicated resource type.		

3.3.1 Burials

No systematic inventory of burial sites has been conducted within the study area however, 17 sites in the region have been reported to contain human skeletal remains. These include two historic cemeteries, 11 cave or crevice burials and 4 reports of human skeletal remains in association with other cultural features such as **middens** or canoes.

Burial practices of coastal Native peoples varied considerably through time and between communities. Above-ground disposals were common in late prehistoric and early historic times among most coastal groups. Corpses were frequently wrapped and placed in **canoes**, on platforms or in boxes. The boxes were then put in trees, in mortuary houses, on scaffolds or simply left on the ground surface. In other examples, individuals were placed in cemeteries located commonly on off-shore islets, on beaches near villages, in groves and in rockshelters or crevices. Burials within shell **middens** were apparently common earlier in the prehistoric period throughout much of the coast. Such burials are frequently found during excavations of shell **midden** sites suggesting that cemeteries were formerly located within or immediately adjacent to villages.

Many of the islets and small islands located within the study area display potential for human burials. This is particularly true of forested islets located near sheltered bays where large semi-permanent villages were likely to have been located. Midden burials may also be present at the village sites themselves. All such areas have been indicated on the archaeological resource maps. Rockshelter and crevice burials may occur almost anywhere that suitable bedrock exposures occur. These areas are difficult to identify using contour maps and aerial photos, consequently these areas are more difficult to confidently assess during potential mapping.

3.3.2 Habitation Remains

Of the 79 identified archaeological sites within the study area, 52 include evidence of short or semi-permanent habitation. The most common feature associated with such occupations are shell midden deposits. These are thick (up to 5 m or more) layers of broken and crushed shell, animal bones and artifacts resulting from repeated shellfish harvesting and occupation of an area. Such deposits are indicative of repeated short-term or prolonged occupation of an area. Both semi-permanent village sites and short term seasonal camps usually result in shell middens as well as other cultural features such as house platforms, hearths, storage pit depressions and occasionally house Roles or other structural remains. The identified habitation sites in the study area are likely associated with three main types of settlement. These include large semi-permanent village sites, fortified refuge sites, and short term seasonal campsites.

Village sites typically display house platforms as well as relatively deep midden deposits and are usually located in large sheltered bays or coves. Many of the sheltered areas along the coastline and on the medium-sized and large islands within the study area display considerable potential for these types of sites. This site type is by far the most common among the previously identified sites in the area.

Refuge sites are usually located on narrow peninsulas or islets immediately adjacent to larger islands. These sites were used for defensive purposes during aboriginal warfare. They usually include limited midden deposits and structural features associated with fortifications. Ten sites in the study area have been assessed as belonging to this type.

The third site type, short term seasonal campsites, are similar in most respects to village sites though they are generally smaller and contain a more limited range of artifact types and features, reflecting the specific activities that the site was used for. These sites commonly occur in locations where specific resources are plentiful on a seasonal basis. Such sites tend to be found near exceptional fishing or shellfish harvesting areas. Eight such campsites have been identified in the study area.

3.3.3 Intertidal Features

Intertidal resources are likely to be associated with other types of archaeological remains (e.g., adjacent to or near village sites). Canoe-runs are likely to occur in shallow waters adjacent to village areas. Fish traps and weirs are more likely to be found near creek mouths or in intertidal estuaries.

Sea level fluctuations are documented to have occurred throughout the west coast of Vancouver Island during the last 12,000 years (Andrews and Retherford 1977; Clague et al., 1982; **Friele** 1991). This is likely to have resulted in inundation and erosion of some very old (i.e., 5,500 years before present or older) archaeological sites. In some instances portions of sites remain relatively intact, though waterlogged. Such ‘wetsites’ can be particularly valuable sources of archaeological information because they frequently contain artifacts made from wood and plant materials as well as other organic cultural debris not normally found at other sites.

Eleven sites containing intertidal features have been previously identified within the study area. These include seven sites containing fish traps, three containing fish weirs and at least one containing a canoe run. No **wetsites** have been reported in the study area. Numerous additional areas displaying potential for intertidal resources have been identified within the study area. These primarily include shallow waters adjacent to or near **suitable** village or campsite locations or near the mouths of substantial creeks and streams.

3.3.4 Rock Art

As mentioned above no rock art sites have been recorded within the study area. This is not unexpected since rock art is generally uncommon on the northwest coast of Vancouver Island. The location of rock art is difficult to predict. Pictographs and petroglyphs can occur wherever bedrock outcrops or large boulders are found. Such locations could not be confidently identified using the available resources, consequently no attempt has been made to assess the potential for rock art sites in the study area.

3.3.5 Culturally Modified Trees

Two recorded sites within the study area contain culturally modified trees (**CMT**). In both cases the trees are associated with **midden** deposits and other archaeological features. It is not at **all** surprising that so few **CMTs** have been identified in the study area. Until recently archaeologists paid little attention to these features, however, their potential value is now being realized. Cultural modifications to trees are functionally specific and can be dated very precisely, consequently **CMTs** provide an excellent record of traditional aboriginal forest use. Surveys specifically designed to locate and record **CMTs** are now becoming standard practice.

Culturally modified trees are common throughout the northwest coast. Archaeologists define **CMTs** as any tree that has been intentionally altered by Native people (Stewart 1984). **CMTs** are of two basic types: bark-stripped trees and aboriginally-logged trees. The former are the result of bark collecting whereas the latter were produced during procurement of wood. Aboriginally-logged trees (or simply “logged trees”) may be standing or fallen. Logged trees can be further divided into several different kinds such as aboriginal stumps, test hole trees, plank stripped trees, planked stripped logs, canoe blanks, etc.

CMTs tend to occur within areas which are easily accessible from navigable waters and are frequently found within or near village sites. Western red cedar, yellow cedar (cypress) and western hemlock were most commonly used, although modified trees of other species have also been found. Tall healthy trees appear to have been preferred. **CMTs** are rarely found among stands of thin and stunted trees. Understandably, **CMTs** are seldom found within areas which have been recently logged.

Assessment of **CMT** potential within the study area has been based primarily on consideration of forest cover, proximity to navigable water, and proximity to potential habitation areas. Most areas within ca 500 m of coastlines which contain old stands of cedar and/or hemlock, as indicated on Ministry of Forest’s forest cover maps, have been indicated as possessing **CMT** potential, though several areas which contain unusually short and/or low quality trees were excluded.

4.0 POTENTIAL IMPACTS

Adverse impacts to archaeological resources can result from land-altering development or increased use of an area. Such impacts occur under conditions that include: (1) destruction or alteration of all or part of an archaeological site; (2) isolation of a site from its natural setting; and (3) introduction of physical, chemical or visual elements that are out-of-character with the archaeological resource and its setting (Apland and Kenny 1992:14). Adverse impacts can be **direct** or indirect. Direct impacts are most commonly caused by land altering development activities, while indirect impacts result from activities other than actual project actions, such as use of a newly developed facility.

Though no specific plans regarding development activities within the study area are available, a preliminary assessment of potential impacts due to use and possible future development can be made. This is followed by recommendations for further archaeological research which will assist in appropriate management of archaeological resources within the study area.

Development and recreational use of the study area is likely to **result** in some adverse impact to both identified and yet undiscovered archaeological resources. The most significant threat to the resources is probably ongoing recreational use of the islands and intertidal water areas. These indirect impacts are likely to be in the form of unintentional damage to resources by boaters and campers as well as intentional destruction and looting of sites by vandals. Rock art and human remains, particularly above ground burials, are especially susceptible to vandalism.

Unfortunately, such impacts are very difficult to prevent in an area as large as the study area. The first step in attempting to minimize these impacts is to conduct a complete inventory of sites so that changes in their integrity can be monitored and particularly vulnerable sites identified and protected. Actually preventing indirect impacts is more difficult, though public education emphasising the importance of protecting these resources may prove somewhat effective.

Direct impacts to archaeological resources may result from development of boating and other recreational facilities within the study area. Areas suitable for camping or mooring **are** likely to have been similarly used by prehistoric inhabitants of the area. Obviously development of camping facilities could potentially result in the most substantial impacts, and construction of some marine facilities such as wharfs can result in significant adverse impacts to intertidal resources.

5.0 MANAGEMENT RECOMMENDATIONS

The review of the historical and ethnographical literature has identified some 92 traditional use locations or place names, but there is little or no information on Native history and aboriginal use for most of these. In **several** instances these places coincide with recorded archaeological sites and it seems likely that archaeological remains are likely to be associated with many more. Further research should involve extensive work with Chickleset and Kluwan elders to identify all aboriginal places in the study area and to develop a context so that the places can be understood in terms of Chickleset and Kluwan history and land use. This research should involve field visits with cultural advisors to traditional use sites, named places and archaeological sites. The research should include archaeological site survey and evaluative testing which will record physical evidence of aboriginal occupation and use of these places.

Specifically, we recommend **that**:

- (1) Mapping of archaeological site potential be completed for the southern portion of the study area. Assessment of archaeological potential was limited to the **Chickleset** Bay portion of the study area, due to budget constraints. This mapping should be completed **for** the southern portion (outer Kluwan Sound) of the study area in order to facilitate the management recommendations presented below.
- (2) A more thorough inventory of place names, traditional use sites and archaeological resources within the study area be conducted. This is clearly a immense task, however it is essential to effective monitoring and prevention of adverse impacts to heritage resources. To facilitate this study, areas within the study area should be prioritized according to intensity of use and probability of future development (i.e., those areas which are likely to be used most intensively should be examined first).
- (3) Attempts be made, through the watchman program, to monitor and protect the integrity of documented archaeological sites in the study area. Sites containing human remains are particularly susceptible to vandalism and thus should be monitored most closely. Specifically these include sites **DISt-1**; **EaSu-1**, 15, 16; **EaSv-5**, 6, 7, 8, 11, 21, 24, 25, 26, 28; and **EaSw-2**, 3, and 4. If considered appropriate, signs may be posted near these sites to inform visitors of their significance and the **(physical** and legal) consequences of their intentional alteration, damage or destruction.
- (4) Detailed archaeological impact assessments should be conducted for any areas which are specifically scheduled for development, with exception of developments in low potential locations. It is essential that such studies be undertaken well in advance of development so that time required to formulate and implement mitigative measures, if necessary, is available.

 HAGGARTY, J., INGLIS, R.; 1984; NON-PERMIT;
 RECONNAISSANCE; NORTHERN NUU-CHAL-MULTH;
 IN 1983 THE SITE WAS IDENTIFIED AND PHOTOGRAPHED
 FROM THE AIR. IN 1984 THE SITE WAS VISITED AND
 VERIFIED. THIS LARGE SHELL MIDDEN COVERS ALMOST
 THE ENTIRE EASY SHORELINE OF AKTIS ISLAND. A
 NUMBER OF WELL DEFINED HOUSE DEPRESSIONS ARE
 EVIDENT. THEY ARE ARRANGED IN AT LEAST THREE
 ROWS PARALLEL TO THE BEACH AND SOME HAVE MODERN
 HOUSES STANDING IN THEM. THE VILLAGE OF AKTIS
 "AS THE MAIN KYUQUOT VILLAGE UP UNTIL THE 1970'S
 AND THE REMAINS OF AT LEAST 15 HOUSES. INCLUDING
 A CHURCH AND AN OLD SCHOOL NWSE ARE STILL
 STANDING. THERE ARE PRESENTLY SEVERAL OCCUPIED
 HOUSES ON SITE (19850122).

UNPUBLISHED REFS 1945 -LETTER FROM R.H. HUMPHRIES, JULY, 1945 (ON FILE), REFERS TO ARTIFACTS COLLECTED FROM 'A HUMP OF AN ISLAND AT THE MOUTH OF CLANNINICK WHICH I BELIEVE HAS SEEN A FORTRESS IN THE OLDEN DAYS. I HAVE DUG UP BONES OF VARIOUS KINDS AND ALSO TWO BONE DAGGERS..' ARTIFACTS WERE ACCESSED TO ROYAL BRITISH COLUMBIA MUSEUM (#6161, 6162).
REMARKS 1983 -SITE WAS IDENTIFIED AND PHOTOGRAPHED FROM THE AIR. IT IS LOCATED ON AN ISLET INSIDE THE EDGE OF A LARGE RIVER DELTA WITH EXTENSIVE CLAM FLATS AND IS CONNECTED TO THE MAINLAND AT LOW TIDE. 1984 -SITE VISITED AND VERIFIED. DEPOSIT COVERS THE E HALF OF THE TOP OF THE ISLET. THE DEPOSIT IS QUITE SHALLOW. NO ASSOCIATED LOWER VILLAGE WAS LOCATED. JANUARY 22, 1985

REMARKS HAGGARTY, J., INGLIS, R.; 1984; NON-PERMIT;
 TERRITORY: RECONNAISSANCE; NORTHERN NUU-CHAH-HULTH;
 SITE WAS OBSERVED AND PHOTOGRAPHED BY G.C. CARL,
 BCPM (SEE 1955, BCPM ANNUAL REPORT, P33). CARL
 REFERS TO AN EXTENSIVE MIDDEN CA 100 YARDS IN
 LENGTH ALONG THE BEACH LINE AND 6-8 FEET DEEP.
 THE SITE WAS GRASS-COVERED. ABOVE THE MIDDEN WAS
 A RELATIVELY FLAT AREA OVERGROWN WITH ALDER
 ALTHOUGH NO EXCAVATIONS OR OTHER SIGNS OF
 STRUCTURES WERE DISCERNABLE. THE 1956 SITE FORM
 WAS TAKEN FROM CARL'S REPORT PLUS ADDITIONAL
 COMMENTS. 1984 - SITE WAS REVISITED AND FOUND TO
 BE ESSENTIALLY DESTROYED BY LOGGING. THE UPPER
 UNITS IN PARTICULAR ARE VERY DISTURBED, ALTHOUGH
 SOME OF THE LOWER UNITS MAY BE INTACT. IT
 APPEARS TO HAVE BEEN A LARGE DEEP MIDDEN.

REMARKS 1955: VILLAGE, UNOCCUPIED FOR AT LEAST 2 YEARS
 AT THE TIME OF OUR VISIT JUDGING FROM THE GROWTH
 OF UNDERBRUSH & OTHER SIGNS. SEE EaSV-1 FOR MAP
 OF LOCATION. 1984: SITE ORIGINALLY OBSERVED IN
 1955 BY G. CARL, BCPM (SEE 1955 BCPM ANNUAL
 REPORT, P. 33), CARL REFERS TO TWO CARVED WOODEN
 FIGURES IN HUMANFORM ENTIRELY OVERGROWN BY
 SALMONBERRY AND OTHER UNDERBRUSH AND IN "AN
 ADVANCED STATE OF DECAY, BEYOND BEING SALVAGED".
 MOST OF THE BUILDINGS WERE EITHER PARTIALLY
 FALLEN DOWN OR IN VERY POOR CONDITION. THE SITE
 WAS OBSERVED IN 1966 BY L. CLAY WHO OBSERVED THE
 REMNANTS OF 3 FRAME HOUSES AND REFERS TO TWO
 TOTEM POLES. CLAY COLLECTED A FRAGMENT OF WORKED
 STONE (SANDSTONE?) ILLUSTRATION ON FILE AT BCPM.
 THE 1967 SITE FORM WAS A COMPOSITE OF THE 1955
 AND 1966 OBSERVATIONS AND "AS RECORDED BY
 MACNAIR FROM INFORMATION GIVEN BY CLAY. 1984
 CONTINUED; THIS IS A MAJOR VILLAGE SITE WHICH IS
 SEPARATED BY A STREAM CHANNEL "A WELL DEFINED
 HOUSE PLATFORMS ON EITHER SIDE OF THE STREAM.
 THERE ARE SEVERAL COLLAPSED HOUSES AND ONE LOG
 STRUCTURE THAT "AS NEVER COMPLETED, ON THE
 EASTERN PORTION OF THE SITE. "THE ENTIRE FRONT
 FACE ON THE EASTERN PORTION "AS SEEN BULL-

WORKED IN AN EFFORT TO STOP THE EROSION. ONE OF THE TWO REPORTED CARVED FIGURES WAS RELOCATED. IT IS A BADLY DETERIORATED HUMAN FIGURE, PERHAPS A WELCOME FIGURE ABOUT 2 M HIGH. WELCOME FIGURE;

REMARKS

BURIAL
BROOKS PENINSULA REFUGIUM PROJECT, 1981: ROLL UNKNOWN
HAGGARTY, J., INGLIS, R.; 1981: NON-PERMIT; ARCHAEOLOGICAL SURVEY; BROOKS PENINSULA: REFUGIUM PROJECT;
THIS SITE IS A SMALL CAVE THAT CONTAINS THREE FRAGMENTS OF A BENT-WOOD BURIAL BOX. NO "AN" REMAINS WERE FOUND IN ASSOCIATION WITH THESE FRAGMENTS. THE COMPLETE LENGTH MEASUREMENT ON 2 OF THE 3 FRAGMENTS (A & C) SUGGEST AN OVERALL LENGTH FOR THE CEDAR BOX OF 50 CM. ONE OF THESE 2 FRAGMENTS (A) SHOWS BOTH ENDS SQUARED WHICH INDICATES TWA? IT IS A LID OR BOTTOM BOARD FRAGMENT FRW A CEDAR BOX MEASURING 50 CM IN LENGTH. THE FRAGMENT WITH NEITHER END COMPLETE (B) IS PROBABLY A LID OR BOTTOM BOARD FRAGMENT BASED ON THE PRESENCE OF 3 SETS OF DRILLED REPAIR HOLES WHICH ARE ALSO COMMON TO FRAGMENT (A). THE THIRD FRAGMENT (C) WITH BOTH ENDS CHARACTERISTIC OF BENT CORNERS IS CLEARLY A SIDE PANEL FRAGMENT IF FRAGMENT (A) IS LID OR BOTTOM BOARD FRAGMENT, A FOURTH CEDAR FRAGMENT, MEASURING (66) X (8) X 2 CM., WAS ALSO FOUND IN THE CAVE BUT SHOWED NO EVIDENCE OF HAVING BEEN WORKED.

FEATURE REMARKS ROUSSEAU, R.
 ROBINSON, M., 19840000
 INGLIS (1984); THE REMNANTS OF WOODEN STAKES ARE LOCATED ON BOTH SIDES OF THE MOUTH OF THE RIVER. THERE ARE CA 7 ROWS WITH BETWEEN 4 AND 15 STAKES IN EACH ROW ON THE S SIDE. ON THE N BANK IS AN ADDITIONAL ROW OF CA 20 STAKES IN AN IRREGULAR PATTERN. ROUSSEAU (1987); THE REMAINS OF THIS WEIR CAN ONLY BE OBSERVED DURING LOW TIDE. AT THE TIME OF INSPECTION IN 1987, ONLY A FEW OF THE STAKES ON THE S SIDE OF THE RIVER COULD BE OBSERVED, AND IT APPEARS THAT THOSE ON THE N SIDE OF THE RIVER HAVE BEEN COMPLETELY COVERED BY GRAVEL AND SAND DEPOSITION CAUSED BY THE RIVER. THE SITE MAP IN THIS UPDATED FOR" INDICATES THE POSITION OF THE WEIR REMAINS AS OBSERVED BY HAGGARTY AND INGLIS IN 1984.

 INFORMANT NAME HAGGARTY, INGLIS, 19840811: THIS IS A LONG,
 COLLECTIONS RELATIVELY NARROW CAM WITH A REAR CHAMBER. THE
 REMAINS OF AT LEAST SEVEN INDIVIDUALS (BASED ON
 SKULL OR SKULL FRAGMENTS), ARE FOUND IN THE MAIN
 BODY OF THE CAVE. THREE OF THE SKULLS SHOW CLEAR
 KOSKIND OR 'SUGARLOAF' DEFORMATION. TWO OF THE
 THREE INDIVIDUALS ARE YOUNG (CA 9 TO 10 YEARS).
 THE RIGHT HUMERUS OF A CHILD, WITH SIX WRAPPINGS
 OF TWISTED CEDAR BARK AROUND THE SHAFT OF THE
 DISTAL END, WAS FOUND ON THE RIGHT SIDE OF THE
 ENTRANCE TO THE CAVE (PHOTO 840: 854, 84: 835).
 ALL SKELETAL MATERIAL AS WELL AS THE NUMEROUS
 BOARDS AND BOARD FRAGMENTS ARE RANDOMLY
 DISTRIBUTED THROUGHOUT THIS FRONT CHAMBER. ALL
 OF THE BOARDS APPEAR TO BE FROM COFFIN-LIKE
 CONTAINERS RATHER THAN TRADITIONAL STYLE BURIAL
 BOXES. THE REAR CHAMBER (BEYOND A NARROW
 PASSAGEWAY). CONTAINS THE REMAINS OF SEVERAL
 INDIVIDUALS, NUMEROUS PLANKS AND ADZED BOARDS.
 THE FLOOR IS LITTERED WITH DECAYING CEDAR BARK
 HATTING.

 1. A STONE FISH TRAP IN THE INTERTIDAL ZONE CONSISTING OF AN ARCUATE ARRANGEMENT OF COBBLES AND SMALL BOULDERS. THE LINE OF BOULDERS/COBBLES MEASURES CA 25 M LONG, AND THE DIMENSIONS OF THE TRAP AREA ARE CA 10 M N-S BY 20 M E-W. HAGGARTY AND INGLIS (1984): THIS IS A SINGLE V-SHAPED STONE WALL FISH TRAP WITH AN OPENING, LOCATED ON A COBBLE/BOULDER BEACH. THE WALLS WERE BUILT FROM BOULDERS REMOVED FROM THE INTERIOR OF THE FISH TRAP. ROUSSEAU (1987): HAGGARTY AND INGLIS (1984) DESCRIBE THE TRAP AS BEING "V"-SHAPED IN CONFORMATION, HOWEVER, IT ACTUALLY APPEARS TO BE MORE ARCUATE. THEY ALSO REPORTED AN OPENING, ALTHOUGH A DEFINITE OPENING WAS NOT OBSERVED IN 1987.

FEATURE REMARKS	ROUSSEAU, 19870531: 1. A "HISTORIC WOODEN BOX MADE OF MILLED LUMBER MEASURING CA 1 M LONG BY .75 M WIDE BY .50 M HIGH LIES AT THE MOUTH OF THE LOWLYING CAVE, AND CONTAINS THE COMPLETE REMAINS OF TWO ADULT INDIVIDUALS. GOT" APPEAR TO BE FEMALE BASED ON CRANIAL MORPHOLOGY, AND SOME TISSUE REMAINS ON THE SKULLS AND JOINTS. ONE OF THE INDIVIDUALS APPEARS TO BE NATIVE, AND THE OTHER "A" BE CAUCASIAN BASED ON CRANIAL MORPHOLOGY AND EVIDENCE OF DENTAL ATTRITION. ASSOCIATED WITH THESE INDIVIDUALS ARE REMAINS OF HISTORIC TEXTILE CLOTHING, A FINE-MESH FISHNET, AND THE REMAINS OF A FISH (ROCKCOO?). 2. SCATTERED WITHIN THE CAVE ARE THE REMAINS OF AT LEAST THREE OTHER ADULT NATIVE (?) INDIVIDUALS (SKULLS MISSING) AND REMAINS OF SEVERAL BROKEN CEDAR PLANK BOXES. THE BOXES APPEAR TO BE OF TWO STYLES: TRADITIONAL BENTWOOD; AND ELONGATE (COFFIN LIKE). ALSO ASSOCIATED WITH ONE OF THE INDIVIDUALS WAS RELATIVELY WELL-PRESERVED PLAIDED TRADITIONAL CEDAR BARK CLOTHING. ALL ITEMS LEFT IN SITU. HAGGARTY AND INGLIS (1984):

COLLECTIONS	HAGGARTY, INGLIS, 19840812: THERE ARE AT LEAST 11 CANOES ON THE SURFACE OF THE W SIDE OF ISLAND IN VARIOUS STAGES OF DECOMPOSITION. ALTHOUGH THIS ISLAND HAS SEEN REFERRED TO AS A CANOE BURIAL LOCATION, THERE IS NO FIRM EVIDENCE OF		

AIR PHOTO REFERENCE	8.C. 4413: 32	ASSOCIATED WITH THE BURIALS ARE THE SCATTERED REMAINS OF A TRADITIONAL BENTWOOD CEDAR BOX (INCLUDING LID), AND SEVERAL SCATTERED CEDAR PLANKS. 4. BURIAL CLUSTER a: THE SCATTERED AND PARTIALLY BURIED REMAINS OF AT LEAST 9 INDIVIDUALS (BASED ON SKULLS, MISC MANDIBLES, POSTCRANIAL ELEMENTS) EXTENDING OVER AN AREA MEASURING CA 3.0 M BY 1.5 M. THREE COMPLETE SKULLS IN THE CENTER OF THE CLUSTER ARE PRESENT: AN ADULT FEMALE WITH CRANIAL DEFORMATION; AND TWO ADULT MALES. A NUMBER OF MANDIBLES AND POSTCRANIAL REMAINS OF IMMATURE AND ADULT INDIVIDUALS WERE ALSO PRESENT. ALSO ASSOCIATED WITH THIS BURIAL CLUSTER "AS A ROUGHLY OVAL ARRANGEMENT OF BOULDERS CA 1 M LONG BY .5 M WIDE COMPOSED OF BOULDERS CA 20-30 CM DIA., AND THE SCATTERED POSTCRANIAL REMAINS OF A SEA MAMMAL (PROBABLY SEAL). THERE ARE PROBABLY MANY MORE THAN JUST 9 INDIVIDUALS IN THIS LOCATION. IT APPEARS THAT THIS CLUSTERING MAY BE OWING TO VANDALS DRAGGING BURIAL BOXES FROM OTHER AREAS OF THE CAM TO THIS LOCATION IN ORDER TO BE ABLE TO SEE THEIR CONTENTS. 5. BURIAL E: THE SCATTERED AND PARTIALLY BURIED REMAINS OF AT LEAST ONE ADULT INDIVIDUAL (SEX INDETERMINATE) ASSOCIATED WITH A ROUGHLY CIRCULAR ARRANGEMENT OF BOULDERS MEASURING CA 2 M DIA., AND SEVERAL LONG CEDAR PLANKS. 6. BURIAL F: A JUMBLED ARRANGEMENT OF SMALL BUILDERS WITHIN AN AREA MEASURING CA 2 M BY 2 M ASSOCIATED WITH LONG CEDAR PLANKS. NO HUMAN REMAINS WERE NOTED IN ASSOCIATION, AND THE BURIAL MAY HAVE BEEN REMOVED. 7. BURIAL G: THE SCATTERED AND PARTIALLY BURIED, POORLY PRESERVED REMAINS OF AT LEAST ONE ADULT MALE CONSISTING OF POSTCRANIAL ELEMENTS AND MANDIBLE (SKULL MISSING). ASSOCIATED ARE A JUMBLED ARRANGEMENT OF SMALL BOULDERS, SEVERAL ELONGATE CEDAR PLANKS, AND PARTS OF A TRADITIONAL CEDAR BURIAL BOX. 8. BURIAL II: THE SCATTERED AND PARTLY BURIED REMAINS OF AT LEAST TWO ADULT FEMALES (BASED ON INNOMINATES, NO SKULLS OR MANDIBLES) OVER AN AREA MEASURING CA 5 I, X .75 II. ASSOCIATED ARE A FEW SMALL BOULDERS, SCATTERED CEDAR BURIAL BOX PARTS, SEVERAL ELONGATE CEDAR PLANKS, AND SEVERAL SHORT PIECES OF CEDAR ROPE. 9. BURIAL I: THE PARTIALLY SCATTERED AND BURIED REMAINS OF AN ADULT "ALE (BASED ON INNOMINATE) IN A SMALL ALCOVE OVERHANG MEASURING CA 1 M WIDE BY 50 CM IN. ONLY POSTCRANIAL ELEMENTS WERE NOTED. 10. BURIAL J: THE SCATTERED, PARTIALLY BURIED. INCOMPLETE REMAINS (SKULL MISSING) OF AN ADULT MALE (BASED ON MANDIBLE) ASSOCIATED WITH TWO
ELEVATION	2	
CONDITION	SIXTY PERCENT INTACT. IT IS QUITE EVIDENT THAT THE BURIALS HAVE BEEN SUBJECTED TO VANDALISM, AS MANY HAVE BEEN DISTURBED, MOST OF THE SKULLS ARE MISSING, AND IT IS PROBABLE THAT MANY OF THE BETTER PRESERVED BURIAL BOXES AND ANY BURIAL INCLUSION WERE REMOVED. THE PRESENCE OF AT LEAST 9 INDIVIDUALS (AND LIKELY MORE) IN BURIAL CLUSTER 0 MAY SUGGEST THAT THE VANDALS MOVED SOME OF THE BURIALS TO THIS LOCATION FROM OTHER DEEPER PARTS OF THE CAVE IN ORDER TO SEE THEIR CONTENTS.	
FUTURE CONDITION	VERY HIGH CHANCE OF FUTURE DISTURBANCE BY VANDALISM THIS LARGE BURIAL CAVE WILL NOT BE DIRECTLY IMPACTED BY THE PROPOSED LOGGING ACTIVITIES, HOWEVER, THERE IS GREAT CONCERN THAT THE LOGGING ACTIVITIES AND THE PROPOSED BATTLE BAY PARK WILL SEE AN INCREASE IN THE NUMBER OF PEOPLE IN THE AREA WITHIN 5 YEARS WHICH WILL GREATLY INCREASE THE CHANCES OF FURTHER VANDALISM AFTER THAT TIME.

FEATURE REMARKS	ROUSSEAU, 19870529: REFER TO SITE MAP FOR LOCATION OF FINDS DISCUSSED BELOW- 1. BURIAL A: THE SCATTERED AND PARTIALLY BURIED POST-CRANIAL REMAINS OF A SUB-ADULT MALE (?) ASSOCIATED WITH: A ROUGHLY CIRCULAR BOULDER PETROFORM (CA 1 M DIA., COMPOSED OF BOULDERS CA 25-40 CM DIA., SCATTERED FRAGMENTS OF A CEDAR BURIAL BOX, CEDAR PLANKS, AND CEDAR ROPE. 2. BURIAL B: A CIRCULAR BOULDER PETROFORM MEASURING CA 1 M DIA COMPOSED OF BOULDERS CA 25-35 CM DIA. NO HUMAN REMAINS WERE NOTED IN ASSOCIATION, BURIAL MAY HAVE BEEN REMOVED. 3. BURIAL C: THE SCATTERED AND PARTIALLY BURIED REMAINS OF AT LEAST TWO INDIVIDUALS SCATTERED OVER AN AREA MEASURING CA 2.5 M BY 1.0 M. AN ADULT FEMALE AS INDICATED BY A" INNOMINATE, AND AN ADULT MALE AS INDICATED BY A MANDIBLE. POSTCRANIAL REMAINS ARE STILL PRESENT, ALTHOUGH THE SKULLS ARE ABSENT.	

<p>FEATURES</p> <p>PHOTOS/IMAGES</p> <p>PUBLISHED REFS</p> <p>WPUBLISHED REFS</p> <p>REMARKS</p> <p>SITE ELEVATION</p> <p>SITE AREA</p> <p>SITE LENGTH</p> <p>SITE WIDTH</p> <p>JURISDICTION</p>	<p>LINEAR ARRANGEMENTS OF MODERATE SIZED BOULDERS (CA 30-45 CM DIA.) SPANNING THE WIDTH OF THE CAVE (CA .75 M). IT IS POSSIBLE THAT MOST OF THE INDIVIDUAL IS BURIED UNDER AND BETWEEN THE BULDERS. 11. BURIAL K: THE SCATTERED REMAINS OF A TRADITIONAL CEDAR BURIAL BOX, NO HUMAN REMAINS WERE NOTED IN ASSOCIATION. ALL ITEMS HRE LEFT IN SITU. THIS LARGE BURIAL CAVE WAS INITIALLY IDENTIFIED BY JIM BASKERVILLE OF STEWART AND EWING ASSOCIATES LTD. (A FORESTRY ENGINEERING COMPANY). THE CAVE IS ACTUALLY A LARGE LINEAR FISSURE IN THE BEDROCK WHICH EXTENDS MORE THAN 100 METERS. ITS ENTRANCE IS NOT VISIBLE FROM THE SEA, AND CAN ONLY BE SEEN ONCE INSIDE THE SHELTERED COVE AREA. THE MOUTH OF THE CAVE IS QUITE LARGE (CA 10 N HIGH) AND CA 3 M WIDE. LARGE PIECES OF DRIFTWOOD ARE PRESENT WELL INTO THE CAVE (UP TO 20 M FROM ITS MOUTH) A N D BURIAL A BORDERS ON T H E LIMIT OF THE DRIFTWOOD. MOST OF THE BURIALS ARE LOCATED FROM BETWEEN 20 TO 50 N INTO THE CAVE FROM ITS MOUTH. ALTHOUGH AT LEAST 18 BURIALS WERE CONFIRMED TO EXIST IN THE CAVE BASED ON THE NUMBER OF SKULLS, MANDIBLES, INNOMINATES AND IMMATURE POSTCRANIAL REMAINS, IT IS ESTIMATED THAT IT IS POSSIBLE THAT THE REMAINS OF AT LEAST AS "ANY AS 50 INDIVIDUALS MAY BE PRESENT. MANY OF THE ELEMENTS ARE PARTIALLY BURIED (AND A GOOD NUMBER ARE LIKELY COMPLETELY BURIED). LOCATION OF BURIAL CLUSTERS 1. BURIAL CLUSTER A:
THE SCATTERED POSTCRANIAL REMAINS OF TM
INDIVIDUALS IN AN AREA ABOUT 2.0 M IN DIAMETER.
PRESENT ARE AN ADULT FEMALE (BASED ON INNOMINATE
MORPHOLOGY) AND A CHILD BETWEEN 7 TO 10 YEARS
OLD (BASED ON MANDIBULAR TOOTH ERUPTION).
CURIOUSLY, THE MARROW CAVITY OF THE PROXIMAL END
OF A BROKEN FEMUR BELONGING TO THE ADULT WAS
'STUFFED' WITH SEVERAL PIECES OF ROLLED COPPER
(BEADS?) WHICH SUGGESTS THAT SOME POST-
DEPOSITIONAL SECONDARY TREATMENT TO THE BURIAL
TOOK PLACE. BOTH SKULLS ARE ABSENT. THESE TW
INDIVIDUALS LIE IMMEDIATELY ABOVE THE HIGHEST
TIDE "ARK, AS THERE IS AN ACCUMULATION OF
DRIFTWOOD BESIDE THEM. SEVERAL PIECES OF CEDAR
PLANKING AND AN ADZED LOG MAY HAVE ORIGINALLY
BEEN ASSOCIATED WITH THE BURIALS SOMEHOW. 2.

REMARKS THIS SITE IS SITUATED IMMEDIATELY BEHIND A
WELL-DEFINED NATURAL "CANOE RUN" THAT AFFORDS
EASY ACCESS TO THE SAND AND GRAVEL BEACH 1"
FROM THE SITE. THIS NATURAL CHANNEL ALSO
SERVES TO REDUCE IF NOT ELIMINATE ENTIRELY "AM
ENERGY FROM PREVAILING WINDS AND SURF. THE BACK
OR W EDGE OF THE SITE ABUTS A GENTLY RISING
HILLSIDE. THE SITE IS BOUNDED TO THE N AND S BY
TWO SMALL INTERMITTENT STREAMS. LARGE SITKA
SPRUCE, 4-600 YEARS MD, GROW ON THE FRONT EDGE
OF THE FLAT UPPER MIDDEN PLATFORM AS WELL AS ON
THE LOWER PLATFORM OR TERRACE. THESE TREES
SUGGEST A POSSIBLE MINIMA TERMINATION DATE FOR
SITE OCCUPATION. THE RELATIVELY NARROW WIDTH OF
UPPER MIDDLE PLATFORM MAY BE EXPLAINED BY THE
FACT THAT INITIAL DEPOSITS WERE LAID DOWN ON A
OLDER SAND AND GRAVEL BEACH BURN, PRESENTLY
BEHIND AND PROTECTED BY THE MODERN LOG/GRAVEL
BURN, WHICH MAY HAVE BEEN MORE EXPOSED TO STRONG
WINTER WINDS AND SURF ORIGINATING FROM THE SE.

	AS A RESULT, WAVE ACTION MAY HAVE PARTIALLY ERODED THE FRONT FACE OF THIS SITE IN THE PAST. ALTHOUGH TODAY THE SITE IS WELL PROTECTED. SLUMPED AND MIXED MATERIAL IS PRESENT IN THE UPPER LEVELS OF THE LOWER PLATFORM. THESE MATERIALS OVERLY STERILE BEACH SANDS AND GRAVELS. LOCATION	BROOKS PENINSULA, ON THE SE SHORELINE OF BROOKS		AT LEAST 17 CM HIGH. THE HEIGHT MEASUREMENT IS
	PENINSULA APPROX 1.7 KM NW OF QUINEEX REEF, 2.9		INCOMPLETE. THE BOX HAS SPRUNG APART AT THE
	KM NE OF WINEEX IR 8.		PEGGED CORNER. WOODEN PEGS AND PEG HOLES ARE
	BY BOAT OR FLOAT PLANE.		PRESENT ALONG THE BOTTOM EDGE OF ALL FWR PANEL
ACCESS	BC; CB		FRAGMENTS, ALTHOUGH THERE IS NO DECORATION ON
PROVINCE/TERRITORY	ROPER, LAND DIST		ANY OF THE PANELS. ALL PANELS HAVE BEEN FINELY
LEGAL DESCRIPTION	COMOX-STRATHCONA		ADZED, INSIDE AND WY, AND SMOOTHED AND
REGIONAL DISTRICT	STRATHCONA		BLACKENED ON THE OUTSIDE. THE THREE BENT CORNERS
PARKS			OF THE BOX EXHIBIT A DETAILED BERF DESIGN:
			EXTERIOR SURFACE • INTERIOR SURFACE (SEE SOURCE

	DOCUMENT FOR DIAGRAM). THE EXTERIOR SURFACE HAS BEEN NOTCHED TO PREVENT SPLITTING OF THE CEDAR FIBRES " " EN THE PANEL IS STEAMED AND BENT. THE INTERIOR SURFACE "AS BEEN CAREFULLY NOTCHED SO THAT THE ADJOINING PANELS OF THE THREE GENT CORNERS ARTICULATE WITH PRECISION. THE 'ID OR BOTTOM BOARD FRAGMENT WAS PARTIALLY COVERED WITH AND EMBEDDED IN MOSS AND LEFT IN SITE. THE WIDTH MEASUREMENT OF THIS FRAGMENT (33 CM) IS PROBABLY INCOMPLETE AS THERE IS A 2 CM WIDE ROUNDED RIM ON THE FRAGMENT THAT WOULD EXTEND BEYOND THE PERIMETER OF THE Box PANELS WHEN ASSEMBLED. THIS WOULD RESULT IN A" OVERALL WIDTH MEASUREMENT OF 37 CM RATHER OVERALL WIDTH MEASUREMENT OF 37 CM RATHER THAN THE 33 CM WIDTH OBSERVED IN THE FIELD. ALTHOUGH DIFFICULT TO DETERMINE, NO PEGS OR PEG HOLES WERE DETECTED IN THE FRAGMENT. THIS TENDS TO SUPPORT THE VIE" THAT THE FRAGMENT FUNCTIONED AS A LID RATHER THAN A BOTTOM BOARD FOR THE BOX. IN CLOSE PROXIMITY TO THIS FRAGMENT WERE A, LEAS, 2 AND POSSIBLY MORE CRANIA' REMAINS OF HUMAN INFANT. THESE REMAINS WERE ALSO COVERED IN MOSS AND, THEREFORE, LEFT UNDISTURBED. ARCHAEOLOGICAL SURVEY; BROOKS PENINSULA:
REFUGIUM PROJECT;
THE SITE IS BOUNDED BY A SHALLO INTERMITTENT
STREAM AT IT'S W EDGE AND BY A GENTLY SLOPING
HILLSIDE TO THE S. TO THE E, THE DEPOSIT
GRADUALLY PETERS OUT ON LEVEL TERRAIN. THE FRONT
EDGE OF THE DEPOSIT (N FACING) IS APPROX SEVEN M
BACK FROM THE BEACH EDGE. THE ENTRANCE TO THE
SMALL BAY IN FRONT OF THE SITE CONTAINS A NUMBER
OF SMALL REEFS. THE BAY ITSELF IS WELL PROTECTED
FROM PREVAILING WINDS AND SURF. THE SIZE OF THE
DEPOSIT SUGGESTS THE SITE WAS USED AS A SEASONAL
CAMP RATHER THAN A MORE PERMANENT VILLAGE.

REMARKS	1994: THIS IS A SKELETON RECORD. THE LATITUDE AND LONGITUDE GIVEN ARE APPROXIMATE. THE THOMAS A. FOSTER WAS A BARK (BARQUE), A THREE MASTED VESSEL WITH STERN MAST FORE AND AFT RIGGED AND REMAINING MAST SWARE RIGGED. THE HAWAIIAN BARK THOMAS A. FOSTER LEFT ESQUIMAULT DECEMBER 9 1885 WITH 1650 TONS OF COAL FOR HONOLULU. ON LEAVING PORT SHE ENCOUNTERED A HEAVY SOUTHWEST GALE AND STARTED TAKING ON WATER. BY DECEMBER 12TH ALL CREW WERE REQUIRED AT THE PUMPS TO PREVENT HER FROM SINKING. ON SIGHTING CAPE FLATTERY ON THE 16TH THE SHIP ENCOUNTERED A NORTHEAST GALE. WITH 12 FT OF WATER IN THE HOLD THE BOAT "AS HEADED FOR THE BEACH ABOUT 8 MILES EAST OF CAPE COOK. THE CAPTAIN , F.Y. RUGG, AND CREW ABANDONED SHIP IN THE ONLY REMAINING LIFEBOAT. THEY REACHED HE SHORE WHERE THE" REMAINED FOR 22 DAYS AS WHICH TIME THEY WERE TAKEN BY INDIANS TO KYOQUOT VILLAGE "HERE THEY STAYED UNTIL THE SIR JAMES DOUGLAS CONVEYED THEM TO VICTORIA NEARLY THREE MONTHS AFTER THE THOMAS A. FOSTER WAS WRECKED. SEE THE "ASGC FILES CONCERNING THIS WRECK AND ITS HISTORY.	ELEVATION	N. VANCOUVER IS.
