

Chlorophenol Aquatic Life Water Standards

Schedule 3.2 of the Contaminated Sites Regulation (the Regulation) provides aquatic life water standards for chlorophenols. These standards consist of a range of concentrations for chlorophenol isomers in the classes:

- monochlorophenols
- dichlorophenols
- trichlorophenols
- tetrachlorophenols
- pentachlorophenol

Footnote 26 of Schedule 3.2 in the Regulation indicates that chlorophenol standards vary with pH, temperature, and substance isomer and that a Director should be consulted for further advice.

This technical guidance document provides the Director's advice on how to select applicable aquatic life water standards for these substances.

Dependence on pH, temperature, and isomer

Typically, chlorophenol aquatic toxicity increases with:

- decreasing pH,
- increasing water temperature, and
- increasing chlorination.

This has important implications for environmental protection, because water temperature is subject to seasonal variation and pH can change from location to location.

The Schedule 3.2 *minimum* standard for each discrete chlorophenol isomer was selected as the lowest concentration at a temperature of 20 °C and a pH < 6.2. The *maximum* standard for each chlorophenol isomer was selected as the highest concentration at a temperature of 0°C – 4.5°C and a pH > 9.1.

Director's advice

The Schedule 3.2 chlorophenol isomer standards for the protection of aquatic life may be compared to contaminated site results in two ways.

Option 1. Direct comparison with minimum Schedule 3.2 chlorophenol isomer standards

At sites for which the aquatic life water standards apply, if the concentration of a chlorophenol isomer does not exceed the minimum standard for that isomer listed in Schedule 3.2, the site would meet the standard for the substance.

Example:

Schedule 3.2 provides the following aquatic life standards for chlorophenol, 2- (CAS # 95-57-8): 19.5 – 6,500 µg/L. Thus, at any site where the chlorophenol, 2- aquatic life protective standards are applicable, the site is considered to have met numerical standards if the maximum concentration of chlorophenol, 2- in water does not exceed 19.5 µg/L.

Option 2. Comparison with temperature, pH and isomer-specific standards for chlorophenols

At sites for which the aquatic life water standards apply, Tables 1–5 (attached) may be consulted to establish the appropriate chlorophenol isomer aquatic life water standard(s) for the site. *Note:* if a person uses the attached tables, water pH and temperature must be measured at the site.

Example:

Groundwater adjacent to a former wood treatment site contains 138 µg/L of trichlorophenol, 2,4,5-. The summertime groundwater temperature was 8.0°C, and the pH was 6.8. The applicable standard is obtained from Table 2, which applies to temperatures of 5.0–9.5 °C. The fourth column from the left contains standards for a pH of 6.8, and the value for trichlorophenol, 2, 4, 5- is 18 µg/L. The observed concentration of 138 µg/L exceeds the 18 µg/L standard, thus the site is considered to be contaminated for the substance.

Since chlorophenol toxicity varies with water pH and temperature, chlorophenol isomer concentrations must be measured during the warmest season of the year and sufficient seasonal characterization should be undertaken to ensure worst case conditions are considered.

If aquatic life standards apply at a contaminated site, the practitioner may need to consider the transport of groundwater to nearby surface water, which is often a higher temperature than groundwater and thus a lower standard applies to protect biota, in accordance with [Technical Guidance 15, "Concentration Limits for the Protection of Aquatic Receiving Environments"](#).

Revision history

Approved Date	Effective Date	Document Version	Notes
October, 2005	October, 2005	1.0	Issued - new Technical Guidance 9
	November 1, 2017	2.0	Updated for CSR Stage 10 amendments

Isomer, pH, and Temperature-Specific Tables for Contaminated Sites Regulation Aquatic Life Water Standards for Chlorophenols

In accordance with the Contaminated Sites Regulation, Schedule 3.2, footnote 26, aquatic life protective water standards for chlorophenols can vary with pH, temperature, and substance isomer. Tables 1–5 constitute the advice of the Director regarding the appropriate aquatic life protective water standards to use for chlorophenols.

Notes:

1. The following tables may only be used if measured values of isomer concentrations, water pH, and temperature are known for the site.
2. Water temperature should be measured to the nearest 0.5 °C.
3. Water pH should be measured to the nearest 0.1 pH unit.
4. Chlorophenol isomer concentrations should be measured to the nearest 0.1 µg/L.
