<b>9) Roles and Responsibilities</b>	<b>22</b>

## **1) Introduction**

In February of 2014 Nona Phillips Forestry Consulting was contracted to develop a Vegetation Resources Vegetation Inventory (VRI) ground sampling plan for the 100 Mile Timber Supply Area (TSA). This included Volume Audit (VA) and Air Call samples. This document outlines the procedures undertaken in the project's sample selection process. The format follows the outline in section 7.2 of the *Sample Selection Procedures for Ground Sampling*.

## **2) Data assembly Process**

All the shapefile data was obtained from Chris Mulvihill, the project coordinator with Ministry of Forests, Lands & Natural Resource Operations ('the Ministry'). This included VRI data in the VRIMS format clipped to the outside TSA boundary. Matt Makar provided an Access Query database to extract Rank 1 Layer data from the VRIMS data.

### **Exclusions:**

The following process was undertaken to net down the land base.

- Created Shapefiles for all the removals. Selected for Private (code 40), Parks (codes 51, 63, and 67), IR (code 52), and any other ownerships specified by the contract. Called this Landbase\_exclusions.
- Dissolved the above file to make the erase from the land base more efficient and called it Landbase\_Exclusions\_Dissolved.
- Erased the Netdown\_dissolve shape from the TSA Boundary file. Created a new shapefile called TSA\_Net.
- Clipped the VRI Shapefile to TSA\_Net. Call this VRI\_net\_prelim.
- Conducted a "Repair Geometry" on the file.
- Added a new field for each called New\_Area and calculated the field.
- Eliminated polygons less than .01ha and created a new file (called this VRI\_Poly\_Net).

The table below is a summary of the area of the TSA.

**Table 1: 100 Mile TSA Landbase Summary**

Land Classification	Area (ha)	% of Proj Area
Total TSA Area	1,235,978	100
Net-downs	175,113	14.17%
Parks	53,264	4.31%
Private	116,451	9.42%
Federal	5,398	0.44%
<b>Net Area</b>	<b>1,060,865</b>	85.83%
Non Vegetated	53,363.00	4.32%
Vegetated	1,007,502.00	81.51%
Non-Treed	129,363.00	10.47%
Treed	878,139.00	71.05%

- Extracted Rank 1 Layer data from the VRIMS using Matt Makar's Access Query. Exported this new file to Excel (provided more reliable results when joining to the shape than the Access format).
- Created a new shapefile class of the VRI data by joining the Excel tables to the VRI\_Poly\_Net file exporting the data (called this 100 Mile\_VRI\_Net)
- Created a new field called Proj\_Ht and calculated.
- Created new fields for height class and Age Class and calculated.

### **3) Creation of Population Shapefiles**

- From 100 Mile\_VRI\_net selected for VT and Projec\_age $\geq$ 51 and create a new file (call it 100 Mile\_VA). The total area of the volume audit population is 716,549 ha or 82% of the VT.
- Selected for VT>30 and called this Air\_Call\_Pop. The total area of the air call population is 770,593 ha or 88% of the VT.

## **4) Sample Selection for the Volume Audit Population**

### **4.1 Stratification**

In order to make decisions about stratification, a summary by leading species was run. This provided the leading species distribution shown below.

**Table 2: Species Distribution for Volume Audit**

<b>Species</b>	<b>Area</b>	<b>%</b>
FD	370211	51.7%
SX	151091	21.1%
PL	111965	15.6%
AT	49850	7.0%
BL	29106	4.1%
CW	3058	0.4%
EP	1039	0.1%
PY	146	0.0%
PA	67	0.0%
BA	16	0.0%
<b>Total</b>	<b>716549</b>	<b>100.0%</b>

**Table 3: Age Class Summary for Volume Audit**

<b>Age Class</b>	<b>Area</b>	<b>%</b>
3	28,267	4%
4	86,364	12%
5	122,662	17%
6	113,602	16%
7	123,286	17%
8	215,736	30%
9	26,632	4%
<b>Total</b>	<b>716,549</b>	<b>100%</b>

Based on this information, the Ministry staff identified the following strata for the 100 Mile TSA VA ground sampling project.

**Table 4: Volume Audit population Strata Definition**

<b>Strata</b>	<b>Leading Species</b>
1	Douglas Fir
2	Spruce & Balsam
3	Pine
4	Other

Shapefiles were created for each stratum.

The number of samples for the Volume Audit population was specified by the Ministry in the Contract Schedule A document. They specified that there would be 70 initial samples and 30 replacements in the Volume Audit population.

**Table 5: Distribution of Ground Samples - Volume Audit Population**

Stratum	Population Area	% of Area	No of Samples	# of Hectars Represented by each plot	Replacement Samples
FD	370,211	51.7%	36	10,284	15
Sp & Balsam	180,213	25.2%	18	10,012	7
Pine	112,178	15.7%	11	10,198	5
Other	53,947	7.5%	5	10,789	3
<b>Total</b>	<b>716,549</b>	<b>100.0%</b>	<b>70</b>	10,236	<b>30</b>

#### **4.2) Sub-stratification**

For the Volume Audit population sub-stratification was carried out the same way for all 4 strata. The process is described below.

- Exported the attribute table from each of the stratum shapefiles
- In these new worksheets, sorted data by Basal Area (BA)
- Determined the number of polygons in each stratum
- Divided total number of polygons by 3 to determine the number of polygons (approx) that should be in each sub-stratum.
- Used the “number of polygons per sub-strata” figure determined above in the table sorted by BA to find the BA figure that would be used to divide the sub-strata.

The table below shows the criteria defining the sub-strata.

**Table 6: Criteria for Sub-stratification of Volume Audit Population**

Strata	# of Polygons	Div by 3	Sub Strat	Target Polygon Range	BA	Actual no of Polygons
FD	21787	7263	1	0-7263	0-14	6967
			2	7264-14526	15-25	7984
			3	1452+	26+	6837
Sp & Bal	15112	5037	1	0-5037	0-15	5487
			2	5038-10074	16-30	5650
			3	10075+	31+	3975
Pine	8276	2759	1	0-2759	0-10	3683
			2	2760-5518	11-20	2476
			3	5519+	21+	2117
Other	5779	1926	1	0-1926	0-15	1987
			2	1927-3852	16-30	2289
			3	3853+	31+	1503

Sample distribution in the Volume Audit population was based on area representation of the sub-strata. The table below shows this distribution.

**Table 7: Distribution of Samples in VA Sub-strata**

Strata	Sub-strata	Area	%	Samples	Replacements
Douglas Fir	1	111,329	30%	11	5
	2	130,773	35%	13	5
	3	128,108	35%	12	5
Total		370,210	100%	36	15
Spruce & Balsam	1	51,682	29%	5	2
	2	69,876	39%	7	3
	3	58,654	33%	6	2
Total		180,212	100%	18	7
Pine	1	47,159	42%	5	2
	2	35,831	32%	3	2
	3	29,189	26%	3	1
Total		112,179	100%	11	5
Other	1	14,089	26%	1	1
	2	20,096	37%	2	1
	3	19,762	37%	2	1
Total		53,947	100%	5	3
Grand Total		716,548		70	30

### **4.3 Sample Polygon Selection**

Volume audit samples were chosen using the probability proportional to size with replacement technique (PPSWR).

- An Excel random number spreadsheet was obtained from the Ministry that creates random numbers from a “seed”. Random numbers between 0 and the total area of each sub-stratum were produced for samples and replacement samples in each of the sub-stratum. As well, one extra random number per stratum was produced for a contingency sample in the event that a sample was eliminated during the sample location stage.
- Accumulated area tables were produced for each of the sub-stratum. This was done by selecting for the sub-strata criteria in the strata shapefiles and exporting the table.
- Two new columns were added to the accumulated area table for recording the samples that were chosen (I for initial, R for replacement and C for contingency) and sample number. The accumulated volume table was then sorted by I/R and then by sample number. All other rows were deleted (saved as Samp list full – sub-stratum). Another table was created from this with just mapsheet, polygon, selection, and area columns (called Samp list part-sub-strat). Using the random numbers generated for each sub-stratum, polygons were selected. A polygon was selected from the accumulated area table if the random number was larger than the accumulated area of the polygon immediately preceding it and less than or equal to its accumulated area.
- Initial Sample Polygons were selected first followed by replacement sample polygons then by contingency samples.

Initial sample numbers were numbered 1 to 70 and alternate samples were numbered 71-100.

### **4.4 Location of Samples Within Polygons**

For each population, samples were located within selected polygons using an Arcmap 10.1 GIS program as follows:

- A new shapefile was created for samples with the following fields:

FID_1	Sample_no	Strata	Sub-strat	X	Y

\*FID\_1 is to link with the Objectid field in the immature VRI shapefile for joining these two files later on.

- The population, 100m grid (obtained from the Ministry), and Landsat shapefiles were displayed on an Arcview map.
- Sample polygons were displayed using the selection tool in the population attribute table.
- For each polygon to be sampled, random numbers were generated (with a range between 1 and the total number of dots in the polygon) for each selected polygon using “=Randbetween(1,X)” function in an Excel spreadsheet. The random numbers were recorded in a new column in this spreadsheet.
- The sample was located at the location of the randomly selected dot.
- The location was then checked against the Landsat image to see if any samples fell in a recent cutover. **The original sample 70 was in a cutover and was replaced with a contingency sample in the same sub-stratum.**
- After sample location was complete for a population, UTM coordinates were calculated then the sample shapefile was joined to the population VRI shapefile so that all veg information would be included in the sample file.

## **5) Sample Selection for Air Call Samples**

Selected sample polygons as described in **Sample Polygon Selection** above (except there was no stratification). The sample numbers will be 101-200.

Created the sample list.

## **6) Quality Assurance**

The following identifies the QA points in the sample selection process.

- Checked Supplied VRI shapefile.
- Repaired geometry following clipping
- Checked polygon lines after clip and erase processes
- Checked distribution between VT and total area
- Checked for data gaps and did not find any.
- Checked UTM outputs correct
- Checked sample lists to make sure ages and species correspond to correct population, strata and sub-strata
- Checked sample distribution on map of TSA
- Checked sample distribution against population distribution by age class, species, and height class and these were very close (see tables below)

The following tables show how the sample distribution compares to the population distribution for age class, height class, leading species, and (for Volume Audit only) strata. Sample and populations compare quite closely.

**Table 8: Volume Audit Age Class Comparison**

Age Class	Area	%	Sample s	%
3	28,267	4%	1	1%
4	86,364	12%	10	14%
5	122,662	17%	10	14%
6	113,602	16%	8	11%
7	123,286	17%	11	16%
8	215,736	30%	26	37%
9	26,632	4%	4	6%
<b>Total</b>	<b>716,549</b>	<b>100%</b>	<b>70</b>	<b>100%</b>

**Table 9: Volume Audit Height Class Comparison**

Height Class	Population Area	Population %	Samples	Sample %
1	1346	3%		0%
2	15947	31%	18	26%
3	26860	53%	40	57%
4	6660	13%	12	17%
5	139	0%		0%
8	1	0%		0%
<b>Total</b>	<b>50953</b>	<b>100%</b>	<b>70</b>	<b>100%</b>

**Table 10: Volume Audit Species Comparison**

Species	Area	%	Sample s	%

## **7) Sample Lists and their Use**

The following are sample lists for Volume Audit and Air Calls.

The Volume Audit list contains initial samples for data collection and replacement samples in the event that some of the initial samples need to be replaced during the data collection phase. For the Volume Audit population (51+) there are 70 initial samples and 30 replacement samples. The initial samples are numbered 1 to 70 and the replacements are numbered 71-100.

During the Volume Audit sampling project, samples can be rejected at the field sampling stage if they are in an unsafe location or in a recent cutover. When replacing samples they must be from the same stratum and sub-stratum (Basal Area Class). The project manager must be consulted if samples are rejected.

The Air Call sample list (31+) included 100 polygons that will be sampled. There are no alternate samples. The samples are numbered 101 to 200.

The shapefiles for each of the samples include all of the data fields from the original supplied VRI database.

## 100 Mile Volume Audit Sample List

Sample	Type	Sub_Strat	UTM Zone	X	Y	POLYGON_NU	BA	Stems/ha	Sp	Sp%	Ht	Age

## **8) Selection Issues**

There were no selection issues.

## **9) Roles and Responsibilities**

All work was completed by Nona Phillips Forestry Consulting with no work being contracted out. Blake Foster performed the GIS work to net down the land base, develop strata and sub-strata and select samples. Nona Phillips oversaw the process and reviewed the product.

Prepared by: Blake Foster

Date: April 12/14

I believe that all steps were carried out correctly and the distribution is random as guided by the VRI Standard, *Sample Selection Procedures for Ground Sampling, Draft Version 4.0*.
