

Snow Survey and Water Supply Bulletin – January 1st, 2018

The January 1st snow survey is now complete. Data from 76 snow courses and 64 automated snow weather stations around the province, collected by the Ministry of Environment Snow Survey Program and partners, and climate data from Environment and Climate Change Canada have been used to form the basis of the following report¹.

Weather

Fall and early-winter weather had been variable across the province. October featured near-normal (-0.5 to 0.5 °C) temperatures across most of the province, with areas of warmer temperatures in north-east BC. Wet conditions were prevalent in northern, central and eastern BC. During October an extreme rainfall event occurred on Vancouver Island, Central Coast and North Coast and led to flooding in some areas.

November was wet across most of the province, particularly in south-west and north-east BC. A series of atmospheric river events impacted south-west BC with heavy rain. Temperatures were generally near normal for southern BC, with warmer minimum temperatures in south-east BC. In northern BC temperatures were colder than normal, with most areas experiencing monthly average temperatures that were 2-5 °C below normal.

Weather patterns flipped in December, ushering in the dominance of Arctic air across British Columbia. Temperature departures were variable across the province, with most areas experiencing slightly below normal temperatures. High pressure throughout the month deflected major weather systems away from the province, and led to drier than normal conditions. Weather transitioned into more westerly flow with increasing precipitation towards the end of the month.

Snowpack

Snow basin indices for January 1st 2018 range from a low of 52% of normal in the Stikine to a high of 141% in the Similkameen (Table 1 and Figure 1). Generally the province has near-normal snow pack for January 1st, with the average of all snow measurements across the province at 96%. Well below-normal snowpack (<65%) is present in the Stikine. Above normal snow pack is present in the Okanagan and Similkameen. Near-normal snowpacks (80-110%) are present throughout the rest of the province.

Two key weather factors have been driving the seasonal snowpack development so far this year. First, cool and wet weather in November led to rapid development of the early-season snow pack. By late-November snow pack at ASWS was 120-125% of average across the province. The second key factor was the dominance of dry, Arctic air through December. While temperatures were low, precipitation was limited, and there was very limited accumulation of snow throughout the majority of the month. Towards the end of December westerly flow patterns brought back snow accumulation, including low elevation snow in southern BC.

Snow Survey and Water Supply Bulletin – January 1st, 2018

Table 1 - BC Snow Basin Indices – January 1, 2018

| Basin | % of Normal | Basin | % of Normal |
|-------------------|-------------|------------------|-------------|
| Upper Fraser West | 94 | Boundary | 97 |
| Upper Fraser East | 109 | Similkameen | 141 |
| Nechako | 98 | South Coast | 106 |
| Middle Fraser | 86 | Vancouver Island | 96 |
| Lower Fraser | 99 | Central Coast | 79 |
| North Thompson | 83 | Skagit | 63 |
| South Thompson | 90 | Peace | 82 |
| Upper Columbia | 91 | Skeena-Nass | 93 |
| West Kootenay | 92 | Stikine | 52 |
| East Kootenay | 106 | Liard | 97 |
| Okanagan | 123 | Northwest | NO DATA |

*Note January 1st snow basin index values are based on limited observation points

January's snow survey schedule features fewer individual snow survey measurements than occur in later survey periods in the year. Some January 1st snow basin indices are therefore based on a very limited number of surveys (e.g. 1-2 surveys within the snow basin) (Table 1) making the data interpretation less robust compared to survey periods later in the season. This is particularly relevant for assessing the low snow pack in the Stikine, and high snow pack in the Similkameen, where each basin index is only based on two surveys. All available January 1st snow measurements are provided at the end of this report.

Outlook

La Niña conditions are present in the equatorial Pacific Ocean. The Climate Prediction Centre (CPC) at the U.S. National Weather Service/NOAA has issued a La Niña Advisory and is forecasting a high likelihood of La Niña persisting through this winter. Typically, La Niña is linked to cooler winters across British Columbia. Snowpacks tend to be higher than normal; however, there has been a large range of variability in snowpack in BC during La Niña winters in the past.

Seasonal forecasts (January to March) from Environment and Climate Change Canada are indicating an increased likelihood of normal temperatures across western British Columbia and below normal temperatures in south-east BC. Short-to-medium term forecasts are suggesting warmer temperatures through January. A period of wetter weather is forecast for the province through the middle of the month, and will likely lead to increased snow accumulation over higher terrain.

By early January, nearly half of the annual BC snowpack has typically accumulated. At this early stage in the season snow accumulation is looking typical across the province. While high snow pack in the south-central part of the province (Okanagan and Similkameen) and

Snow Survey and Water Supply Bulletin – January 1st, 2018

low snow pack in the Stikine may be early indicators of flood and drought risk in those regions, it is still early in the snow season; with three or more months left for snow accumulation, these outlooks could change significantly. In recent La Niña winters, for example, increased snow packs have generally emerged later in the snow season (i.e April and May) despite modest January 1st snow basin indices.

The River Forecast Centre will continue to monitor snow pack conditions and will provide an updated seasonal flood risk forecast in the February 1st 2018 bulletin, which is scheduled for release on February 7th.

Snow Survey and Water Supply Bulletin – February 1st, 2018

The February 1st snow survey is now complete. Data from 86 snow courses and 69 automated snow weather stations around the province, collected by the Ministry of Environment Snow Survey Program and partners, and climate data from Environment and Climate Change Canada have been used to form the basis of the following report¹.

Weather

January weather patterns affecting British Columbia were mixed. Generally, the month featured above-normal (+0.5 to 2.0 °C) temperatures across most of the province, with areas of warmer temperatures in the Kootenays. The first half of the month was mild with light precipitation and subdued snow accumulation. Several significant storm events affected the province in the second half of January, especially for the southern half of the province. An atmospheric river in late January created flood conditions on Vancouver Island. January precipitation totals were well above normal for the southern half of BC, while the Northwest and North Coast regions were below normal.

Snowpack

Snow basin indices for February 1st 2018 range from a low of 51% of normal in the Northwest to a high of 165% in the Skagit (Table 1 and Figure 1). Overall, the province has a slightly-above normal snow pack for February 1st, with the average of all snow measurements across the province at 108%, increasing significantly from 96% of normal on January 1st. Well-below normal snowpack is present in the Stikine (67%) and Northwest (51%). Well-above normal snow pack (>130%) is present in the Okanagan, Similkameen, Lower Fraser, South Coast, Skagit and Vancouver Island. Above normal snow pack (110-120%) is present in the East Kootenay, West Kootenay and Boundary regions. Near normal snowpacks (80-110%) are present throughout the rest of the province. The Fraser River snow index as an entire watershed is 101% of normal.

Table 1 - BC Snow Basin Indices – February 1, 2018

| Basin | % of Normal | Basin | % of Normal |
|-------------------|-------------|------------------|-------------|
| Upper Fraser West | 92 | Boundary | 116 |
| Upper Fraser East | 101 | Similkameen | 135 |
| Nechako | 84 | South Coast | 139 |
| Middle Fraser | 96 | Vancouver Island | 148 |
| Lower Fraser | 141 | Central Coast | 82 |
| North Thompson | 92 | Skagit | 165 |
| South Thompson | 104 | Peace | 90 |

| West Kootenay | 117 | Stikine | 67 |
| East Kootenay | 115 | Liard | 84 |
| Okanagan | 131 | Northwest | 51 |

1. Every effort is made to ensure that data reported on these pages are accurate. However, in order to update the graphs and indices as quickly as possible, some data may have been estimated. Please note that data provided on these pages are preliminary and subject to revision upon review.

Snow Survey and Water Supply Bulletin – February 1st, 2018

The persistent unsettled weather in late-January for the southern half of the province increased the snow pack considerably. The most dramatic increases occurred for south coastal regions. Vancouver Island increased from 96% on January 1st to 148% of normal, the South Coast from 106% to 139% of normal, and the Lower Fraser from 99% to 141% of normal.

Outlook

La Niña conditions are present, with negative sea surface temperature anomalies across much of the eastern and central sections of the equatorial Pacific Ocean. Over the past month sea surface temperature anomalies have steeply declined in the northern Pacific Ocean off the coast of the BC, with cooler than normal temperatures now dominant. The Climate Prediction Centre (CPC) at the U.S. National Weather Service/NOAA is forecasting a high likelihood of La Niña persisting through the winter, with a transition to ENSO-neutral conditions expected during the spring. Typically, La Niña is linked to cooler winters across British Columbia and snowpacks tend to be higher than normal. Over the past 6 weeks weather patterns have aligned with typical La Niña weather, bringing significant growth to the provincial snow pack.

Seasonal forecasts (February to April) from Environment and Climate Change Canada are indicating an increased likelihood of normal temperatures across western and southern British Columbia and below normal temperatures in south-east and northern BC. Short-to-medium term forecasts are suggesting near normal temperatures through February. A storm event is currently impacting the Interior, Central Coast and North Coast, with significant snow accumulation occurring in many areas.

By early February, nearly two-thirds of the annual BC snowpack has typically accumulated. High snow packs in the South Interior, including the Skagit, Similkameen and Okanagan, may be an early indication of increased seasonal flood risk for the upcoming freshet season. In coastal areas, including Vancouver Island and South Coast flooding on local river systems generally occurs in the fall-winter period, and spring flood risk is minimal. In the Lower Fraser, high snow pack can contribute to increased spring flood risk on the Lillooet River and tributaries, and increased seasonal runoff in the spring can also contribute higher local inflows to the lower reaches of the Fraser River.

Seasonal volume runoff forecasts (see below) are near-normal (85-105%) for the Upper Fraser, Middle Fraser, Thompson and Skeena/Bulkley basins, and well above-normal (>120%) for areas of the South Interior, including the Okanagan, Similkameen and Nicola. Similarly the snowmelt component of seasonal runoff on Vancouver Island, South Coast, Lower Fraser and Skagit is expected to be higher than normal given the high snow pack in those regions. Well below normal snow packs in the North-west and Stikine are an early indication of the potential for below normal seasonal runoff.

Snow Survey and Water Supply Bulletin – February 1st, 2018

While other areas of the province remain below 120% of normal snow pack, the trend in weather patterns and snow accumulation over the past month has been significant, with considerable growth in the snow pack across the province. This pattern has continued into early-February, with recent storm paths having a more northerly track than earlier this season, delivering increased snow accumulation into central and northern BC. Given the current seasonal weather forecasts, and ocean temperature trends, on-going above average snow accumulation appears to be a probable scenario over the remaining period of the snow accumulation season. The amount of snow accumulation and locations which receive the most snow will depend on the on-going weather patterns through the next 2-3 months.

The River Forecast Centre will continue to monitor snow pack conditions and will provide an updated seasonal flood risk forecast in the March 1st 2018 bulletin, which is scheduled for release on March 8th.

Snow Survey and Water Supply Bulletin – March 1st, 2018

The March 1st, 2018 snow survey is now complete. Data from 133 snow courses and 78 automated snow weather stations around the province, collected by the Ministry of Environment Snow Survey Program and partners, and climate data from Environment and Climate Change Canada forms the basis of the following report¹.

Weather

The weather in February was very cold with high precipitation for most of the province. Temperatures in the Interior were well below normal (-2 to -7 °C). Temperatures were not as cold on Vancouver Island or the South Coast, and ranged from normal to slightly below normal (0 to -2 °C). Precipitation was well above normal for most locations in the Interior. A major snow storm affected a large area of the province in the first week of February, and several moderate storms continued to add to the Interior snow pack. Conditions were drier than normal on Vancouver Island and the South Coast.

Snowpack

Snow basin indices for March 1st 2018 range from a low of 68% of normal in the Stikine to a high of 144% in the Similkameen (Table 1 and Figure 1). Overall, the province has an above normal snow pack for March 1st. The average of all snow measurements across the province is 119% of normal, increasing significantly from 108% of normal on February 1st. A well-below normal snow pack is present in the Stikine (68%) and Northwest (73%). Near normal snow packs (80-110%) have accumulated in the Liard, Peace, Skeena-Nass, Nechako, North Thompson and Upper Fraser East. Above normal snow packs (110-130%) are present in the Lower Fraser, South Thompson, Upper Columbia, West Kootenay, South Coast, Vancouver Island and Central Coast. Well-above normal snow packs (>130%) are present in the Upper Fraser West, Okanagan, Similkameen, Boundary and Skagit. The Fraser River snow index as an entire watershed is 110% of normal.

Table 1 - BC Snow Basin Indices – March 1, 2018

| Basin | % of Normal | Basin | % of Normal |
|-------------------|-------------|------------------|-------------|
| Upper Fraser West | 138 | Boundary | 136 |
| Upper Fraser East | 108 | Similkameen | 144 |

1. Every effort is made to ensure that data reported on these pages are accurate. However, in order to update the graphs and indices as quickly as possible, some data may have been estimated. Please note that data provided on these pages are preliminary and subject to revision upon review.

Snow Survey and Water Supply Bulletin – March 1st, 2018

Several large storm systems affected the North Coast and Interior in February, considerably increasing the snow pack. Most snow packs in the North Coast and Interior increased by 10% or more from February 1st values. Drier weather on Vancouver Island and the South Coast dropped snow pack indices by 10-30% of normal compared to February 1st.

Outlook

La Niña conditions in the equatorial Pacific Ocean have eased over the past month. The Climate Prediction Centre (CPC) at the U.S. National Weather Service/NOAA is forecasting a high likelihood transitioning to ENSO-neutral conditions into the spring. While La Niña is waning, it is not uncommon for the effects of La Niña to persist several months beyond the period of the defined La Niña event. For example, snow packs in previous La Niña events in British Columbia tended to grow more rapidly than normal through the March and April periods. Province-wide snow basin indices during La Niña years tend to increase by 3-5% over the March 1st to April 1st period, and increase by 5-10% over March 1st to May 1st. While there is still uncertainty over how weather patterns will play out over the next few months, continued increases in snow basin indices into April and May are likely to occur, given this year's La Niña context.

Seasonal forecasts (March to May) from Environment and Climate Change Canada indicate an increased likelihood of normal temperatures across most of British Columbia. Short-to-medium term forecasts suggest some warming through the end of the current week, and a transition to cooler and wetter weather into the middle of the month.

Nearly 80% of the annual BC snow pack typically accumulates by early March. Very high snow packs (>135%) in the South Interior (including the Skagit, Similkameen, Okanagan, Boundary and Upper Fraser West), and high snow packs (>120%) in the Kootenay indicate an increased seasonal risk of flooding. Given this year's La Niña conditions, it is unlikely that the risk will ease much prior to the melt season. While the snow pack in the overall Fraser River basin is moderately above normal (110%), a high snow pack (122%) in the Lower Fraser, can contribute to increased spring flood risk on the Lillooet River and tributaries; increased seasonal runoff in the spring can also contribute higher local inflows to the lower reaches of the Fraser River. Given the potential for increasing snow packs over the next 4-8 weeks, there is the possibility of increasing seasonal flood risk in other areas of the province.

Seasonal volume runoff forecasts (see below) are near-normal (95-110%) for the Upper Fraser, Middle Fraser, Thompson and Skeena/Bulkley basins, and well above-normal (>130%) for areas of the South Interior, including the Okanagan, Similkameen and Nicola. Similarly, the snowmelt component of seasonal runoff on Vancouver Island, South Coast, Lower Fraser and Skagit is expected to be higher than normal given the high snow pack in those regions. Below normal snow packs in the North-west and Stikine are an early indication of the potential for below normal seasonal runoff.

1. Every effort is made to ensure that data reported on these pages are accurate. However, in order to update the graphs and indices as quickly as possible, some data may have been estimated. Please note that data provided on these pages are preliminary and subject to revision upon review.

Snow Survey and Water Supply Bulletin – March 1st, 2018

Snow pack is one element of seasonal flood risk during BC's freshet season. Weather patterns during the snow melt season play a critical role in whether or not flooding occurs. Intense or prolonged rainfall and extreme temperatures are important factors that can lead to flooding, even for areas with a near normal snow pack.

The River Forecast Centre will continue to monitor snow pack conditions and will provide an updated seasonal flood risk forecast in the April 1st 2018 bulletin, which is scheduled for release on April 9th.

Snow Survey and Water Supply Bulletin – April 1st, 2018

The April 1st, 2018 snow survey is now complete. Data from 132 snow courses and 74 automated snow weather stations around the province (collected by the Ministry of Environment Snow Survey Program, BC Hydro and partners), and climate data from Environment and Climate Change Canada forms the basis of the following report¹.

Weather

The weather in March was relatively cool and remained dry for most of the month until several storm systems moved through the province at the end of the month.

Temperatures across the British Columbia were near normal to slightly below normal (-2 to 0°C relative to normal). Precipitation was well above normal for most locations in the Interior, and significantly below normal for Vancouver Island and the South Coast.

Snowpack

Snow basin indices for April 1st 2018 range from a low of 65% of normal in the Stikine to a high of 152% in the Similkameen and Okanagan regions (Table 1 and Figure 1). Overall, the province has an above normal snow pack for April 1st. The average of all snow measurements across the province is 127% of normal, increasing significantly from 119% of normal on March 1st.

Well-above normal snow packs (>130%) are present in the Upper Fraser West, Okanagan, Similkameen, Boundary, and Skagit. The April 1st snow index for the Okanagan is 152% of normal, which is tied with April 1999 for the highest snow pack dating back to 1980. Above normal snow packs (110-130%) are present in the Middle Fraser, Upper Fraser East, Lower Fraser, Upper Columbia, West Kootenay, East Kootenay, South Coast, and Central Coast. Although the Middle Fraser snow index is 110%, there are areas within the Middle Fraser that are much higher. For example, the Nicola basin has an index of 132%, and snow surveys within the Chilcotin plateau are significantly above normal (>150%). Near normal snow packs (80-110%) have accumulated in the Liard, Peace, Skeena-Nass, Nechako, Vancouver Island, the North Thompson, and the South Thompson. Although the Nechako snow index is considered near normal, two snow surveys within the Nechako basin (1A23 Bird Creek & 1B05 Skins Lake) currently measure all-time record highs. It is thus likely that the Nechako snow index (103%) under-represents certain areas within the entire basin. A well-below normal snow pack is present in the Stikine (65%) and Northwest (72%). Finally, the Fraser River snow index as an entire watershed is 108% of normal.

¹ Every effort is made to ensure that data reported on these pages are accurate. However, in order to update the graphs and indices as quickly as possible, some data may have been estimated. Please note that data provided on these pages are preliminary and subject to revision upon review.

| East Kootenay | 119 | Liard | 83 |
| Okanagan | 152 | Northwest | 72 |

Outlook

The easing trend in La Niña conditions in the equatorial Pacific Ocean, which began in February, is continuing. The Climate Prediction Centre (CPC) at the U.S. National Weather Service/NOAA is forecasting the high likelihood that conditions will continue to transition to ENSO-neutral through the spring, with neutral conditions to develop into the summer. While La Niña is waning, it is not uncommon for the effects of La Niña to persist several months beyond the period of the defined La Niña event. For example, snow packs in previous La Niña events in British Columbia tended to grow more rapidly than normal through April. Province-wide snow basin indices during La Niña years tend to increase by 2-5% over the April 1st to May 1st period. While there is still uncertainty over how weather patterns will play out over the next few months, continued increases in snow basin indices into May are likely to occur, given this year's La Niña context.

Seasonal forecasts (April to June) from Environment and Climate Change Canada indicate an increased likelihood of below normal temperatures for the eastern border of British Columbia and above normal temperatures for the Northwest. Short to medium-term forecasts suggest continued light to moderate precipitation for Vancouver Island and the South Coast for the following week. Precipitation from these events is expected to spill over the Coast Mountains and into the southern interior, likely increasing the mountain snowpack. Temperatures are forecast to be near normal over this period.

By April 1st, nearly 95% of the annual BC snow pack has typically accumulated. For most areas, the transition from snow accumulation to snow melt generally occurs in the middle of April, and therefore the April 1st snow survey is considered to be the key survey of the year for assessing the impact of snow pack on seasonal water supply and flood risk.

Snow Survey and Water Supply Bulletin – April 1st, 2018

Very high snow packs (>145%) in the South Interior (including the Skagit, Similkameen, Okanagan, Boundary and Upper Fraser West), and high snow packs in the Kootenay (>120%) indicate an increased seasonal risk of flooding. Given this year's La Niña conditions, it is unlikely that the risk will ease much prior to the melt season. While the snow pack in the overall Fraser River basin is only slightly above normal (108%), under specific weather conditions it is possible for snow to melt rapidly throughout the entire basin. Increased seasonal runoff in spring can contribute to higher local inflows to the lower reaches of the Fraser River, where there is still a flood risk for the Lillooet River and tributaries depending upon weather conditions. Given the potential for increasing snow packs in the coming weeks, there is the possibility of increasing seasonal flood risk in other areas of the province.

Seasonal volume runoff forecasts (see below) are near-normal (100-110%) for the Upper Fraser, Middle Fraser, Thompson and Skeena/Bulkley basins, and well above-normal (>130%) for areas of the South Interior, including the Okanagan, Similkameen and Nicola. The snowmelt component of seasonal runoff on Vancouver Island, South Coast, Lower Fraser and Skagit is expected to be near to slightly above normal given the snow pack in those regions. Below normal snow packs in the Northwest and Stikine are an early indication of the potential for below normal seasonal runoff.

Hydrological Effects of BC Wildfires in 2017

Forest fires burned the largest area in BC's history during the summer of 2017. These fires affected many watersheds, including large areas in the Cariboo Chilcotin, Thompson Okanagan, West Coast, and Kootenay Boundary regions. Disturbances such as fire affect the hydrologic response of streams, rivers and lakes relevant to potential flooding. Specifically, flows from snowmelt dominated watersheds impacted by fires tend to be greater and peak earlier as compared to undisturbed areas, even under normal weather conditions. Many of the regions affected by burns last summer have above normal snow packs this year.

Areas that will be more susceptible to earlier and higher flows due to potential fire impacts and a high snowpack include: Bonaparte River (Cache), Baezaeko River, Nazko River, Chilcotin River, Deadman River, and West Road River; including minor tributaries/creeks.

Upcoming Freshet

Snow pack is one element of seasonal flood risk during BC's freshet season. Weather patterns during the snow melt season play a critical role in whether or not flooding occurs. Intense or prolonged rainfall and extreme temperatures are important factors that can lead to flooding, even for areas with a near normal snow pack.

Note that missing values reflect that forecasts were not made for that time interval

Disclaimer: Seasonal forecasts were developed using a Principle Component Analysis of snow pack, climate and streamflow data.

Cowichan Lake Inflows are based on a multi-variate regression analysis and reflects a normal scenario for summer weather conditions

The Standard Error in the Cowichan forecast reflects model error, and does not capture uncertainty over seasonal weather

There is inherent uncertainty in runoff forecasts including potential errors in data and the unpredictable nature of seasonal weather

Use at your own risk

Snow Survey and Water Supply Bulletin – May 1st, 2018

The May 1st, 2018 snow survey is now complete. Data from 150 snow courses and 72 automated snow weather stations around the province (collected by the Ministry of Environment Snow Survey Program, BC Hydro and partners), and climate data from Environment and Climate Change Canada forms the basis of the following report¹.

Weather

The weather in April was mixed. Temperatures were generally 1-2 °C or more below normal for most areas of the BC Interior, and closer to normal, or slightly above normal in coastal BC. Precipitation was much higher than normal, particularly in the South Interior, Central Interior and Kootenay. Monthly summaries do not reflect weather patterns within the period. Cool and wet weather for the first few weeks of April led to on-going snow accumulation, followed by a rapid warming late in the month. During a high pressure system late-April temperatures reached into the mid-to-upper 20s, and many daily temperature records were set. This led to a rapid transition to spring conditions, with significant melt of low to mid-elevation snow.

Snowpack

Snow basin indices for May 1st 2018 range from a low of 69% of normal in the Stikine to a high of 264% in Upper Fraser West (Table 1 and Figure 1). Overall, the province has well above normal snow pack for May 1st. The average of all snow measurements across the province is 168% of normal, increasing significantly from 127% of normal on April 1st. Of the 222 snow measurements taken for the May 1st survey period, 60 locations exceeded their previously recorded maximum May 1st values. High snow basin indices reflect actual increases in snow water amounts over the past months in many locations. However, it is important to note that, particularly in areas which typically experience significant melt between April and May, extremely high basin index values can be reflecting the greater difference between current conditions and what would normally be a melting snow pack. Therefore, snow basin index values are enhanced when there is a delay in the melt season.

Extremely high snow packs (>150%) are present in the Upper Fraser West, Nicola, Okanagan, Similkameen, Boundary, Skagit, West Kootenay, East Kootenay. The May 1st snow index for the Okanagan is 206% of normal, which is the highest observed snow pack dating back to 1980. While many snow basin index values increased by 50% or more since April 1st, the amount of increase in snow water content over this period has been more in the 5-16% range for most basins. In the Liard basin, the high basin value represents a delay in the melt season rather than high seasonal snowpack.

¹ Every effort is made to ensure that data reported on these pages are accurate. However, in order to update the graphs and indices as quickly as possible, some data may have been estimated. Please note that data provided on these pages are preliminary and subject to revision upon review.

Snow Survey and Water Supply Bulletin – May 1st, 2018

In general, low to mid-elevation snow pack was significant across the province this year. In the last week of April and the first week of May this snow has been melting rapidly, leading to significant flood challenges in many areas of the province.

Table 1 - BC Snow Basin Indices – May 1, 2018

| Basin | % of Normal | Basin | % of Normal |
|-------------------|-------------|-----------------------|-------------|
| Upper Fraser West | 264 | Boundary | 238 |
| Upper Fraser East | 112 | Similkameen | 210 |
| Nechako | 103 | South Coast | 126 |
| Middle Fraser | 115 | Vancouver Island | 104 |
| Lower Fraser | 125 | Central Coast | 143 |
| North Thompson | 108 | Skagit | 198 |
| South Thompson | 126 | Peace | 84 |
| Upper Columbia | 116 | Skeena-Nass | 90 |
| West Kootenay | 180 | Stikine | 69 |
| East Kootenay | 150 | Liard | 144 |
| Okanagan | 206 | Northwest | 112 |
| Nicola | 204 | Fraser (Entire Basin) | 109 |

Outlook

Seasonal forecasts (May to July) from Environment and Climate Change Canada are indicating an increased likelihood of above normal temperatures across British Columbia, and this has been the general weather pattern over the past two weeks.

By May 1st, 100% of the annual BC snow pack has typically accumulated. For most areas, the transition from snow accumulation to snow melt generally occurs in the middle of April; this transition began at the end of April this year. In low-to-mid elevations snowmelt was rapid over the last week of April and into early May, leading to flooding in many mid-elevation watersheds across the BC Interior.

Extremely high snow packs (>150%) in the Nicola, Similkameen, Okanagan, Boundary, Kootenay and Upper Fraser West are indicating significant flood risks this year, and in many of these areas flooding is already occurring. Snow pack in the South Thompson has also increased significantly over the past month to levels of increased seasonal flood risk. High snowpack in coastal areas tend to have less of an influence on seasonal flood risk, as coastal rivers usually have peak flows in response to extreme rainfall events in the fall and winter. Some rivers do experience "hybrid" regimes, and can have significant flows in the spring. With snow packs this year, elevated risk may be present in the Lillooet River and basins and Central Coast including the Bella Coola River and tributaries, and Dean River and tributaries.

Snow Survey and Water Supply Bulletin – May 1st, 2018

While the snow pack in the overall Fraser River basin is only slightly above normal (109%), under specific weather conditions it is possible for snow to melt rapidly throughout the entire basin. Current flow on the Fraser River at Hope (Water Survey of Canada gauge 08MF005) is 7400 m³/s, which is near or above the maximum recorded flow for this early in the season. Given weather forecasts over the next 10 days the trend of higher than normal flow on the Fraser River is expected to continue. Currently modelling is indicating the potential for flows in the 9,000-10,500 m³/s range at Hope by the middle of May, and the potential to exceed that into the third week of the month.

Snow pack is one element of seasonal flood risk during BC's freshet season. Weather patterns during the snow melt season play a critical role in whether or not flooding occurs. Intense or prolonged rainfall and extreme temperatures are important factors that can lead to flooding, even for areas with a near normal snow pack. Weather patterns forecasted over the next 10 days indicate the potential for deteriorating river conditions in most areas of the province. Typically the freshet flood season in British Columbia lasts from early May to late-June, and is occurring earlier this year. There is still abundant snow at higher elevations to maintain seasonal flood risk for another month or more.

Seasonal volume runoff forecasts (see below) are near-normal or slightly above normal (100-115%) for the Upper Fraser, Middle Fraser, Thompson, Skeena and Cowichan basins. Well above-normal (>140%) for areas of the South Interior, including the Okanagan, Similkameen, and Nicola.

Hydrological Effects of BC Wildfires in 2017

Many areas that were affected by wildfires last year have been experiencing flooding already this spring. Areas which have higher elevation terrain and may still be susceptible to increased flood risk due to the fires include the Chilcotin River, Deadman River and areas in the upper Kootenay River.

The River Forecast Centre will continue to monitor snow pack conditions and will provide an updated seasonal flood risk forecast in the May 15th 2018 bulletin, which is scheduled for release on May 22nd.

1 kdam³=1,000,000 m³

Note that missing values reflect that forecasts were not made for that time interval

Disclaimer: Seasonal forecasts were developed using a Principle Component Analysis of snow pack, climate and streamflow data.

Cowichan Lake Inflows are based on a multi-variate regression analysis and reflects a normal scenario for summer weather conditions

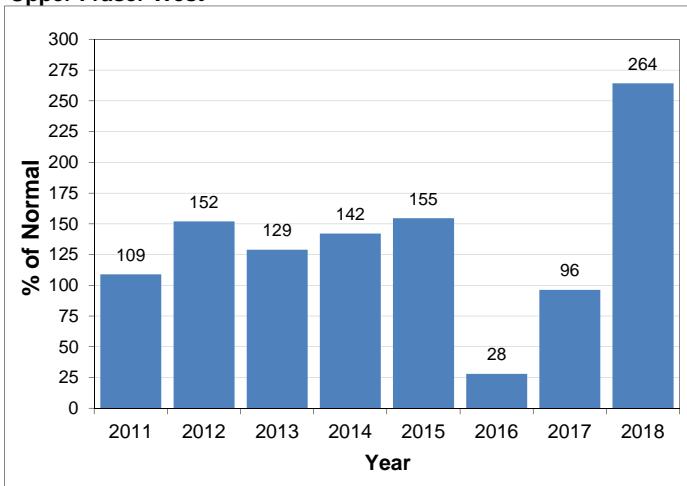

The Standard Error in the Cowichan forecast reflects model error, and does not capture uncertainty over seasonal weather

There is inherent uncertainty in runoff forecasts including potential errors in data and the unpredictable nature of seasonal weather

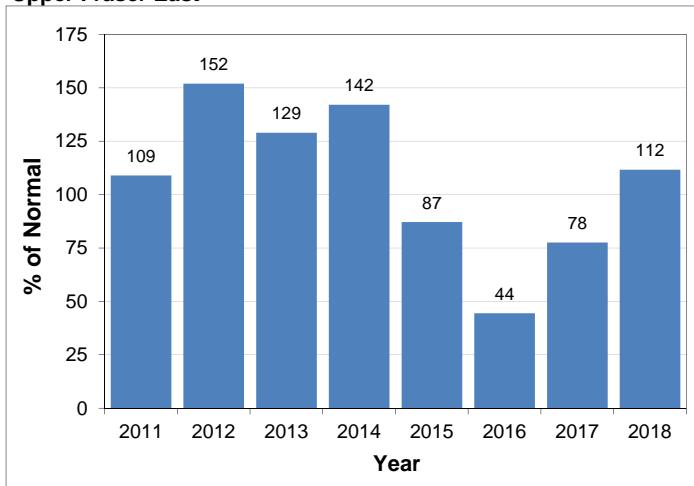

Use at your own risk

Snow Survey and Water Supply Bulletin – May 15th, 2018

The May 15th, 2018 snow survey is now complete. Data from 33 snow courses and 73 automated snow weather stations around the province (collected by the Ministry of Environment Snow Survey Program, BC Hydro and partners), and climate data from Environment and Climate Change Canada forms the basis of the following report¹.

Weather

Weather over the first two weeks of May has been extremely hot, with temperatures 5-10°C above normal across most of the province for most of that period. Heavy rainfall in the Okanagan, Shuswap, Boundary and Kootenay occurred over the May 9-10 period, and exacerbated flood conditions in those regions.

Snowpack

Dramatic snow melt has occurred over the first 2 weeks in May in response to extreme temperatures. Snow basin indices have declined significantly in most areas of the province, reflecting this rapid melt. Snow packs have largely been depleted from low elevation areas. Mid-elevation areas have melted approximately 30-60% of the snow pack, and upper elevations have melted 10-30%. Many basins have below normal snow basin indices, reflecting rapid snowmelt, with many regions experiencing snow conditions in mid-May that are 2-3 weeks ahead of normal. The high May 15th basin indices in some areas, particularly the Similkameen, Okanagan, and Boundary, reflects higher elevation snowpack; with depletion of low and mid-elevation snow in these regions, the flood risk is declining.

Table 1 - BC Snow Basin Indices – May 15, 2018

| Basin | % of Normal | Basin | % of Normal |
|-------------------|--------------------|------------------|--------------------|
| Upper Fraser West | NO DATA | Boundary | 132 |
| Upper Fraser East | 74 | Similkameen | 56 |
| Nechako | 90 | South Coast | 109 |
| Middle Fraser | 84 | Vancouver Island | 79 |
| Lower Fraser | 105 | Central Coast | 93* |

| West Kootenay | 137 | Stikine | 9* |
| East Kootenay | 133 | Liard | NO DATA |
| Okanagan | 126 | Northwest | NO DATA |

*Note several May 15th basins indices are based on limited snow measurements within their watersheds

¹ Every effort is made to ensure that data reported on these pages are accurate. However, in order to update the graphs and indices as quickly as possible, some data may have been estimated. Please note that data provided on these pages are preliminary and subject to revision upon review.

Snow Survey and Water Supply Bulletin – May 15th, 2018

Outlook

Ongoing flood risk from this season's snow pack is primarily associated with the remaining mid-to-upper elevation snowpack. In low-to-mid elevation watersheds, snow melt risks have subsided. Except for watersheds draining high mountain terrain, risks from snow melt are expected to last another 1-3 weeks. This primarily includes the Okanagan Lake system, Fraser River, South Thompson River (including Shuswap Lake and Mabel Lake), North Thompson River and Kootenay region. Future risks of flooding beyond that period will largely be associated with heavy rainfall events.

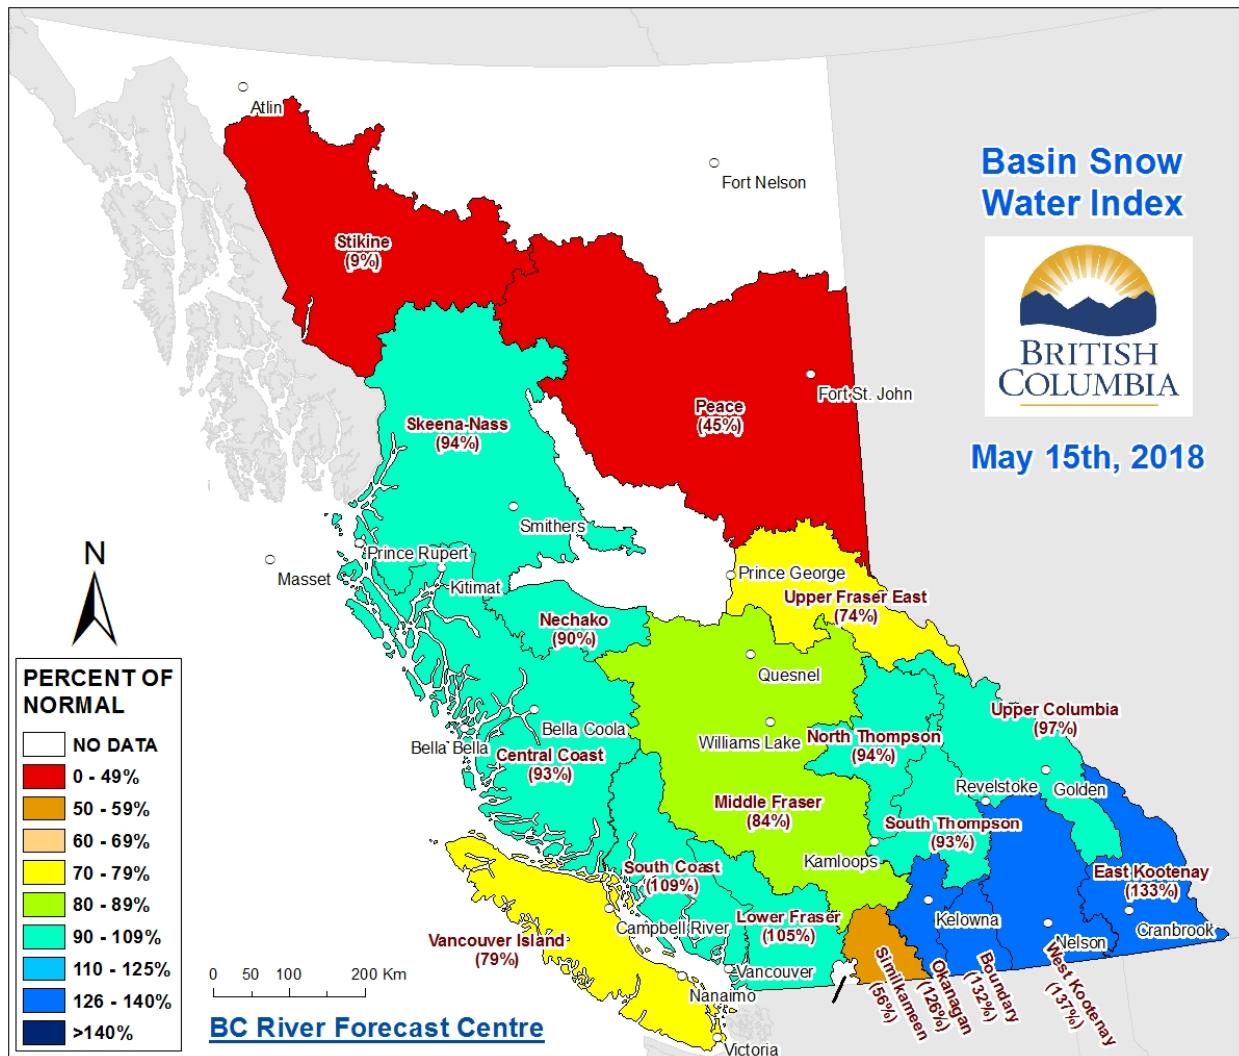

The River Forecast Centre will continue to monitor snow pack conditions and will provide an updated seasonal flood risk forecast in the June 1st 2018 bulletin, which is scheduled for release on June 7th.

Snow Survey and Water Supply Bulletin – June 1st, 2018

The June 1st, 2018 snow survey is now complete. Data from 22 snow courses and 73 automated snow weather stations around the province (collected by the Ministry of Environment Snow Survey Program, BC Hydro and partners), and climate data from Environment and Climate Change Canada forms the basis of the following report¹.

Weather

Weather through May was extremely hot and dry, with weather patterns being dominated by persistent high pressure. Daily average temperatures were typically 3-5 °C above normal across most of the province, with several locations in the South Interior, Coast and central BC having record or near record high monthly temperatures. Rainfall was generally limited, however one heavy rainfall event in the South Interior did contribute to flooding conditions that were observed in Grand Forks and other areas.

Snowpack

Dramatic snow melt occurred through May in response to the extreme temperatures, with many areas transitioning from well above normal snow pack to well below normal snow pack over the course of a few weeks. Snow basin indices have declined significantly in most areas of the province, reflecting this rapid melt. Snow packs have largely been depleted from low and mid-elevation areas. Most basins have below normal snow basin indices, and this is reflecting rapid snowmelt, with many regions experiencing snow conditions in early-June that are 2-3 weeks ahead of normal.

Table 1 - BC Snow Basin Indices – June 1st, 2018

| Basin | % of Normal | Basin | % of Normal |
|-------------------|--------------------|------------------|--------------------|
| Upper Fraser West | 21 | Boundary | 129* |

¹ Every effort is made to ensure that data reported on these pages are accurate. However, in order to update the graphs and indices as quickly as possible, some data may have been estimated. Please note that data provided on these pages are preliminary and subject to revision upon review.

Snow Survey and Water Supply Bulletin – June 1st, 2018

*Note several June 1st basins indices are based on limited snow measurements within their watersheds

Outlook

Flood risk from this season's snow pack has now subsided, and river levels across the province have been receding. In many areas of the province, streamflow has transitioned from well above normal flows in April and May, towards below normal flow in early-June. This is particularly the case on Vancouver Island, coastal BC, northern BC, southern BC and central BC.

While snow melt related flood risks may be diminished, on-going risks from extreme rainfall events continue to exist. From a climatological perspective, June is a month where extreme rainfall does occur in the BC Interior, and continued vigilance around these patterns is prudent for on-going flood response through the rest of this freshet season.

With the shift to earlier melt, snow melt influence on river systems around the province is expected to wane early this year, bringing increased risk for low flows later this summer. These risks include areas which started the freshet season with above normal snow pack. Areas with increased risk for summer low flows this year include the Skeena, Peace, Liard, Upper Fraser West, Middle Fraser/Cariboo, central Coast, Vancouver Island, Okanagan, Lower Fraser and East Kootenay.

While snow plays a role in summer low flows, late-spring and summer weather is ultimately the key driver of whether low flow conditions emerge later this summer or not. Current near-term weather forecasts are indicating that the trend away from the hot and dry weather in May has shifted into cooler and wetter patterns through the middle of June. Long-range seasonal weather forecasts from Environment and Climate Change Canada are indicating an increased likelihood of warmer than normal and drier than normal conditions across the June-July-August period. With early snow melt and the increased likelihood of adverse summer weather conditions, there are increased province-wide risks this year for low flow and drought.

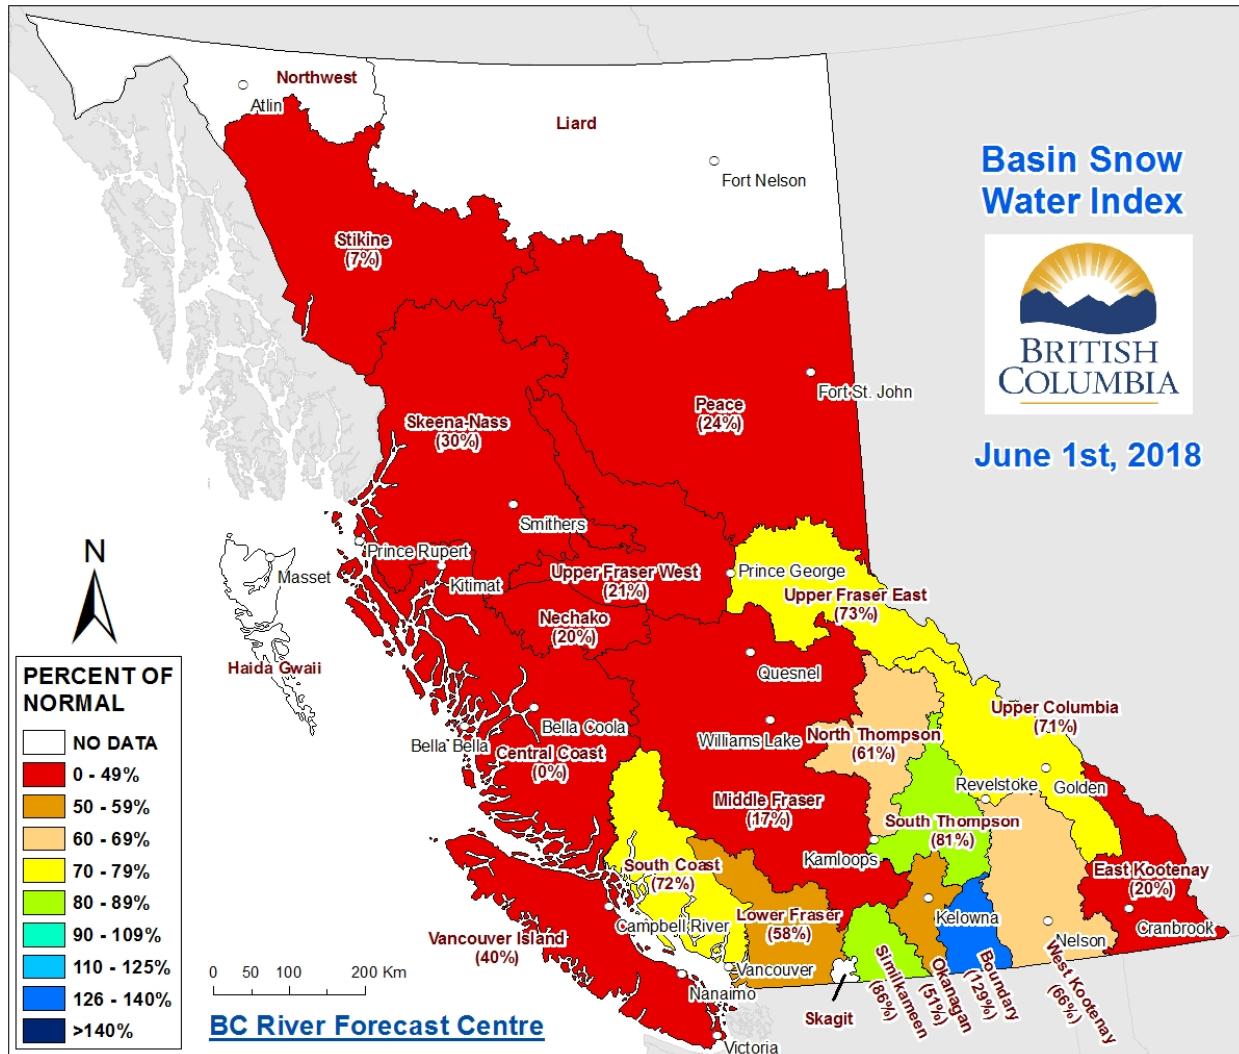

The River Forecast Centre will continue to monitor snow pack conditions and will provide an updated seasonal flood risk forecast in the June 15th 2018 bulletin, which is scheduled for release on June 21st.

Snow Survey and Water Supply Bulletin – June 15th, 2018

The June 15th, 2018 snow survey is now complete. Data from 4 manual snow surveys and 72 automated snow weather stations around the province (collected by the Ministry of Environment Snow Survey Program, BC Hydro and partners), and climate data from Environment and Climate Change Canada forms the basis of the following report¹.

Weather

Hot and dry weather in May transitioned into cooler and wetter weather for the first half of June. This was largely the result of a shift in weather patterns towards more dominant low pressure systems. Over the past week, weather has shifted back to the dominance of high pressure across BC, leading to extremely high temperatures (5-10°C above normal)

Snowpack

Snowmelt rates eased through the first half of June in response to cooler temperatures. Snow basin indices are below normal to well-below normal across the province. This reflects snow conditions that are 1-4 weeks ahead of normal as a result of rapid melt in May. Snow remains at the higher elevations of the province; above 1700-1800 m in the BC Interior and above 1200 m in Coastal BC.

Table 1 - BC Snow Basin Indices – June 15th, 2018

| Basin | % of Normal | Basin | % of Normal |
|-------------------|-------------|------------------|-------------|
| Upper Fraser West | NO DATA | Boundary | 26* |
| Upper Fraser East | 12 | Similkameen | 30* |
| Nechako | 20 | South Coast | 88 |
| Middle Fraser | 18 | Vancouver Island | 24 |
| Lower Fraser | 73 | Central Coast | 0* |
| North Thompson | 38 | Skagit | NO DATA |
| South Thompson | 97 | Peace | 5 |
| Upper Columbia | 66* | Skeena-Nass | 18 |
| West Kootenay | 58 | Stikine | 0* |
| East Kootenay | 27 | Liard | NO DATA |
| Okanagan | 19 | Northwest | NO DATA |

*Note several June 15th basins indices are based on limited snow measurements within their watersheds

¹ Every effort is made to ensure that data reported on these pages are accurate. However, in order to update the graphs and indices as quickly as possible, some data may have been estimated. Please note that data provided on these pages are preliminary and subject to revision upon review.

Snow Survey and Water Supply Bulletin – June 15th, 2018

Outlook

Flood risk from this season's snow pack has now generally subsided, and river levels across the province have been receding. In many areas of the province, streamflow has transitioned from well above normal flows in April and May, towards below normal flow in June. In watersheds draining significant amounts of high elevation terrain (for example the Lillooet River), hot temperatures have led to high flows as the remaining high elevation snow melts.

While snow melt related flood risks may be diminished, on-going risks from extreme rainfall events continue to exist. From a climatological perspective, June is a month where extreme rainfall does occur in the BC Interior, and continued vigilance around these patterns is prudent for on-going flood response through the rest of this freshet season.

While snow plays a role in summer low flows, late-spring and summer weather is ultimately the key driver summer low flow conditions. Long-range seasonal weather forecasts from Environment and Climate Change Canada are indicating an increased likelihood of warmer than normal and drier than normal conditions across the June-July-August period. With early snow melt and the increased likelihood of hot and dry summer weather conditions, there are increased province-wide risks this year for low flow and drought. Drought information, including current drought levels and streamflow conditions, can be found at the [British Columbia Drought Information Portal](#).
