

TFL 47, Draft Management Plan No. 3**Bonanza Lake Management Unit****20 Year Plan (2001 – 2020)**

The 20 Year Plan (20 YP) is consistent with the base case of the Timber Supply Analysis (TSA), which represents current management practices. The 20 YP shows that the harvest plan for the management unit is realistic and that the cutblocks can be spatially distributed over the total harvestable land base (THLB).

The 20 YP is based on a conceptual development of the harvestable land base. The map shows both existing and proposed road access. It is a snapshot in time and not intended to guide the forest development plan process. Harvest volumes are based on the forest inventory, which was updated to the end of 1999.

The plan was developed at a 1:20,000 scale. It started with the preparation of a map showing the harvestable land base with all 100% netdown areas coloured in one colour and all netdowns less than 100% but greater than 50% shown in a different colour. Areas with a netdown of less than 50% are not mapped. Cutblocks are shown within netdown areas to the extent that they are feasible, i.e. polygons with an 80% netdown can still have 20% of the polygon covered with cutblocks.

The plan represents a cut/leave pattern where a concerted effort was made to leave economically viable units for future harvest. Cutblocks were selected with due consideration given to harvest constraints and the requirements of the Forest Practices Code of British Columbia Act (FPC). Harvest in adjacent cutblocks is delayed until green-up (for adjacency) or visually effective green-up is achieved unless the combined opening size does not violate the 40 ha maximum opening guideline. On the 20 YP map the blocks would be separated by one full five year period, i. e. they would be shown in period 1 and 3 e.g.

The Vancouver Island Land Use Plan has not been approved and old growth management areas (OGMA) have not been identified or mapped.

Riparian zones and wildlife tree patches are too small for effective mapping. In addition, wildlife tree patches are identified in the engineering phase. Most of the cutblocks in the 20 YP are reasonable projections based on reconnaissance or local knowledge. The plan reflects all approved inventories.

The 20 YP represents a clearcut harvesting system consistent with the base case of the TSA. The combined impact on harvestable volume as a result of TimberWest's decision to phase out clearcutting and move towards variable retention is estimated at 1.9 percent. However, the tables in this report are based on the "clearcut" system.

TimberWest's Variable Retention harvesting method includes dispersed and variable retention systems. In dispersed retention TimberWest aims to leave single trees spaced approximately one tree length apart which is estimated to equate to 5% basal area or 5% of the total volume. In group retention small groups of trees (minimum 0.1 ha) are left within the harvested area. It is estimated that with current retention levels for resource values such as WTP, riparian areas,

shoreline buffers, visual and recreation concerns any additional impact of aggregate retention harvesting is negligible.

The TSA shows a harvestable volume of 188,100 m³ for the base case. By comparison, this 20 YP shows an average annual harvest of 196,350 m³. In both cases the volumes have to be netted down by 1.9% for the estimated impact of variable retention and 5% for the takeback as a result of the ownership change. Please note that the 20 YP volume includes 298,501 m³ on lands currently classified as inoperable. However, fieldwork has shown that the inoperable area encompasses numerous economically viable cutblocks with small patches of valuable Cypress. Our intent is to use alternate harvest systems such as small cats, hoes or single tree helicopter harvest. Some of the blocks are already approved in Forest Development Plans.

TFL 47, Draft Management Plan No. 3**Johnstone Strait Management Unit****20 Year Plan (2001 – 2020)**

The 20 Year Plan (20 YP) is consistent with the base case of the Timber Supply (TSA) analysis, which represents current management practices. The 20 YP shows that the harvest plan for the management unit is realistic and that the cutblocks can be spatially distributed over the total harvestable land base (THLB).

The 20 YP is based on a conceptual development of the harvestable land base. The map shows both existing and proposed road access. It is a snapshot in time and not intended to guide the forest development plan process. Harvest volumes are based on the forest inventory, which was updated to the end of 1999.

The plan was developed at a 1:20,000 scale. It started with the preparation of a map showing the harvestable land base with all 100% netdown areas coloured in one colour and all netdowns less than 100% but greater than 50% shown in a different colour. Areas with a netdown of less than 50% are not mapped. Cutblocks are shown within netdown areas to the extent that they are feasible, i.e. polygons with an 80% netdown can still have 20% of the polygon covered with cutblocks.

The plan represents a cut/leave pattern where a concerted effort was made to leave economically viable units for future harvest. Cutblocks were selected with due consideration given to harvest constraints and the requirements of the Forest Practices Code (FPC). Harvest in adjacent cutblocks is delayed until green-up (for adjacency) or visually effective green-up is achieved unless the combined opening size does not violate the 40 ha maximum opening guideline. On the 20 YP map the blocks would be separated by one full five year period, i. e. they would be shown in period 1 and 3 e.g.

At Boughey Bay and Brooks Bay partial harvesting is shown as per the forest development plan (FDP), in some cases with future entries in periods 3 or 4 of the 20 YP. Maintenance of Growth and Yield plots at Boughey Bay is accommodated by employing partial harvesting systems.

The Brian Lakes area has been identified as a sensitive area with future recreation potential. The current 20 YP does not encroach on the watershed of Brian Lakes.

Harvest blocks on Quadra Island meet the requirements of the Special Management Zone as we understand them at this time. They are also expected to satisfy concerns of local residents. Multiple harvest entries into a cutblock within the 20 year planning period is shown by cross-hatching, using the appropriate period colours. The TS analysis does not specifically account for the impact of the SMZ on the available harvest. The maximum impact is assumed to be no more than 10%.

The Landscape Unit Plan has not been completed and old growth management areas (OGMA) have not been identified or mapped.

Parks and shoreline buffers are shown on the 20 YP maps. Riparian zones and wildlife tree patches are too small for effective mapping. In addition, wildlife tree patches are identified in the engineering phase. Most of the cutblocks in the 20 YP are reasonable projections based on reconnaissance or local knowledge.

The plan reflects all approved inventories with two exceptions: the recreation and visual landscape inventories for blocks 4-12 have been reviewed and discussed with the CRFD but have not been formally signed off. However, it was agreed with the CRFD to include these two inventories.

The 20 YP represents a clearcut harvesting system consistent with the base case of the TSA. The combined impact on harvestable volume as a result of TimberWest's decision to phase out clearcutting and move towards variable retention is estimated at 1.9 percent. However, the tables in this report are based on the "clearcut" system.

For planning purposes it is assumed that one third of the annual harvest will be dispersed retention while the remaining two thirds will be group retention. In dispersed retention TimberWest aims to leave single trees spaced approximately one tree length apart which is estimated to equate to 5% basal area or 5% of the total volume. In group retention small groups of trees (minimum 0.1 ha) are left within the harvested area. It is estimated that with current retention levels for resource values such as WTP, riparian areas, shoreline buffers, visual and recreation concerns any additional impact of aggregate retention harvesting is negligible.

The TS analysis shows a harvestable volume of 559,350 m³ for the base case. By comparison, this 20 YP shows an average annual harvest of 569,000 m³. In both cases the volumes have to be netted down by 1.9% for the estimated impact of variable retention and 5% for the takeback as a result of the ownership change.

20 Year Plan

July 17, 2000

TFL Forest Ltd.
Kokish Division
Post Office Bag 9000
Port McNeill, British Columbia
V0N 2R0

Attention: Dave Simpson, Operations Planner

Dear Licensee:

Thank you for your June 26, 2000, submission of the Tree Farm Licence 47, 20 Year Plan, compartments 1, 2, 3 and 17. I understand that the 20 Year Plan is a strategic plan which spatially confirms the timber harvesting levels presented in the base case of the Timber Supply Analysis and is information that is considered by the Chief Forester in determining the AAC for the tree farm licence under Section 8 of the *Forest Act*.

With the above in mind, district staff have reviewed the plan to ensure the required content is available as per the Ministry of Forests Tree Farm Licence Management Plan Guidelines (August 1998, Resource Tenures and Engineering Branch). I do note that the plan does include significant areas of land currently classified as inoperable. I also note that this was addressed in the accompanying text and that TFL Forest Ltd. will utilize alternative harvesting systems to harvest volume from these areas.

This letter is the Port McNeill Forest District's approval of the 20 Year Plan as presented and a copy will be forwarded to the Regional Manager, Vancouver Forest Region, as acceptance of the plan for inclusion in the preparation of Management Plan No. 3 for Tree Farm Licence 47.

Yours truly,

Jack Dryburgh
District Manager

Attn: Bruce Storry, RPF
 Operations Planner

Dear Bruce Storry:

Thank you for your Twenty-Year Plan (TYP) submission, dated June 26, 2000, for the Johnstone Straits Division of TFL 47. I appreciate the effort you and your staff have made in preparing this plan and in providing follow-up information as requested by our staff.

In reviewing this plan, we understand that this is not an operational plan; rather, that its intended purpose is to spatially demonstrate to the Chief Forester that the rate-of-harvest proposed for Management Plan Number 3 can be achieved.

One of the key issues which came forward during our review was the projected rate of harvest within Visual Landscape Unit (VLU) polygons. I note that the Information Package and subsequent Timber Supply Analysis are based upon harvest levels within VLUs which *do not* exceed maximum allowable alteration percentages. In general, this modelling assumption is consistent with operational practice.

Within your TYP however, my staff noted instances where the projected rate of harvest appears to exceed those maximum alteration percentages. I assume that this is predicated on the use of retention silvicultural systems and advanced cutblock design techniques to achieve what is projected. This approach is acceptable, provided that operational implementation is successful in meeting the objectives, particularly with respect to windfirmness of retained timber patches and careful use of design. We also have observed that there does appear to be some opportunity to "swap" some of the apparently non-viable harvest entries into timber stands which were not scheduled in this TYP.

Overall, this plan serves to highlight potential concerns which my staff have recently raised in relation to operational performance in Visual Landscape Units as well as with the application of

TFL 47 Twenty Year Plan

retention silviculture systems, particularly in more windthrow-prone areas. Given the importance of both issues to timber supply, I would like to take this opportunity to request that we meet with you and your staff, in the field, to review these issues and develop an action plan. I have in mind that this occur sometime during the month of September and request that you contact John Ingram of this office to arrange such a meeting.

In closing, your Twenty Year Plan is accepted as submitted. We will monitor your progress with issues over the period of this next Management Plan and I look forward to a productive meeting in September.

Yours truly,

Rory Annett
District Manager
