## ***Introduction and Notes to Tables***

This set of stand and stock tables and accompanying graphs was produced as an addendum to the report “Morice TSA: Documentation of Vegetation Resources Inventory Analysis”<sup>1</sup>. The purpose was to provide additional information that may help to address questions related to the mid-term timber supply in the Morice TSA. The scope of this addendum was limited to producing the tables and graphs that follow.

Additional information regarding the data used to generate these tables (population definitions, sample selection details, sampling weights, etc.) can be found in the main report. However, the following details may be helpful in interpreting the stand and stock tables herein.

The two main strata referenced in this analysis (i.e. “mature” and “immature”) correspond with the populations of interest that were sampled for the Morice TSA VRI data analysis:

1. Immature or Young Stand Monitoring (YSM): stands between 15 and 50 years of age (in 2011), *not* restricted to Vegetated Treed (VT) polygons, and
2. Mature or Volume Audit: stands 51 years and older (in 2011) in the Vegetated Treed portion of the landbase.

Fifty samples were established in each of these main strata. A file that identified whether or not a sample was located in the timber harvesting land base (THLB) was provided by Forest Analysis and Inventory Branch staff. The distribution of samples by maturity and THLB is shown below.

*Morice TSA VRI Phase II sample distribution:*

	Non-THLB	THLB
Immature	4	46
Mature	22	28

For the stand and stock tables, an additional age break within the immature stratum was also applied: samples with inventory age 15-29 years (n=29); and samples with inventory age 30-51 years (n=21). Although the age-related stratification (e.g. mature/immature) was based on the Phase I inventory, all volume and stem count data in these tables are based on the Phase II ground sample since tree-level information (i.e. species and dbh class) was required to produce the stand and stock tables.

The Phase II ground sample data is only collected for trees of at least 4cm dbh. Hence the lower bound of the 5cm dbh class is actually 4cm dbh.

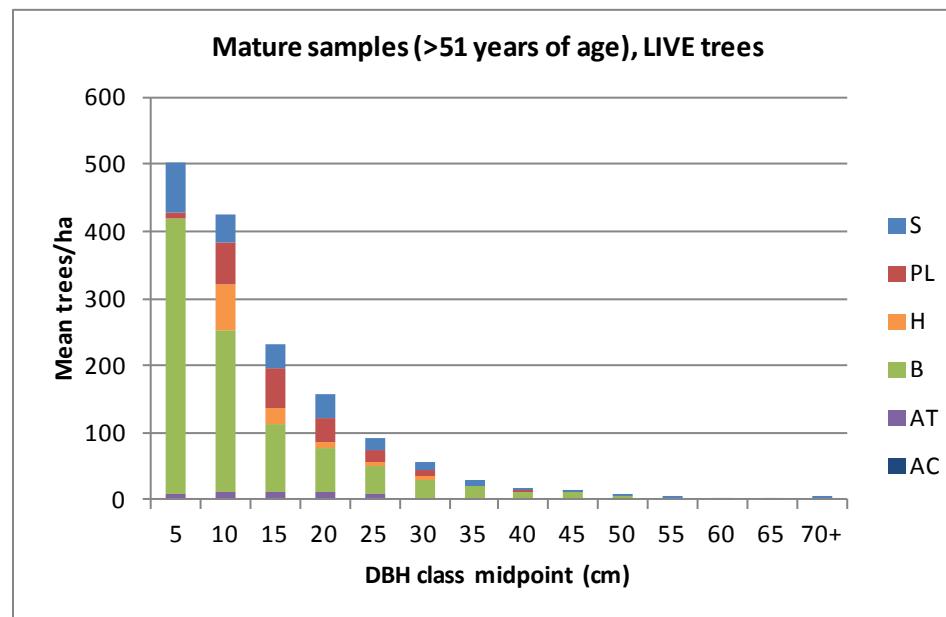

All volumes/ha reported in the stock tables are merchantable volume (10cm minimum top diameter and 30cm high stump) net of decay, waste and breakage. Volumes have been net factored and have had net volume adjustment factors (NVAF) applied. As a result of the merchantability limits, there is no volume reported in the lowest dbh class.

---
