***Re: Balfour Osprey 2000 Gear Oil Spill – Water Quality Update - April 21, 2017***

Water quality samples were taken at nine sites between April 16 – 19, 2017 to document baseline and follow up conditions following the gear oil spill from the Balfour Osprey 2000 that occurred on April 15, 2017 (Table 1, Figure 1, Photos 1 - 9). Analytical services were provided by Caro Analytical in Richmond, BC. Samples were taken from the top 10 – 20 cm of the water column and included surface water. Samples were analyzed for light extractable petroleum hydrocarbons, heavy extractable petroleum hydrocarbons and polycyclic aromatic hydrocarbons. Results are presented in Attachment 1.

The sample taken at Site 4 on April 17 tested positive for heavy extractable hydrocarbons (474 ug/L). Site 4 is 2 m from shore immediately downstream from the first marina dock where oil film was observed on an area of quiet water during both sampling events at this site (April 17<sup>th</sup> and 19<sup>th</sup>). For all other samples analyzed all parameters were below detection limits (Attachment 1).
