## **1.0 INTRODUCTION**

---

### **1.1 Background**

In 2013 new forest inventory mapping was completed over the full extent of Haida Gwaii. The new mapping conducted to the Vegetation Resource Inventory standard provides complete, consistent coverage over the Haida Gwaii archipelago. This replaces the previous inventory which was a set of disparate coverages, some very old, with gaps in some areas, and produced to varying inventory standards.

In 2015 the new inventory was compared against the previous old inventory and results were presented to representatives of the Haida Gwaii Management Council (HGMC). Relative to the old inventory, the new inventory estimated less timber volume. Concerns over the magnitude of change and consequence for the Allowable Annual Cut (AAC) were expressed by the HGMC and the Council of the Haida Nation (CHN). The HGMC and CHN have requested, and the ministry has agreed, to undertake a forest inventory ground sampling program in 2016.

### **1.2 Goals**

The primary goals of the ground sampling programs are to i) assess volume estimates in the new inventory and provide a level of comfort (reduced risk for decision makers) on volume, volume growth, and health of all stands on Haida Gwaii, ii) acquire ground sample data to supplement the photo-interpreted inventory, and iii) establish a long-term forest monitoring plot network across Haida Gwaii.

### **1.3 Ground Sampling Programs**

The three primary goals will be achieved by the three-part sampling objectives outlined below and described in further detail under separate sections of this plan.

- Mature Inventory Audit Program (VRI) : to audit / evaluate the new 2012-2013 VRI Phase 1 inventory on mature stands, and depending on analysis results recommend adjustments to key inventory attributes.
- Change Monitoring Inventory Program (CMI) : To expand the provincial 20km grid monitoring program to include Haida Gwaii in support of FAIB's regional business needs.
- Young Stand Monitoring Program (YSM) : To characterize and monitor the growth and yield of young stands, report on forest health conditions, assess accuracy of species mix and site productivity, and compare against growth model projections used in timber supply review (TSR).

### **1.4 Terms of Reference**

This sample plan was completed by R. de Jong, Forest Analysis and Inventory Branch (FAIB). The subsequent ground sampling phase will be completed and coordinated by R. Bilek, FAIB during the 2016 field season.

### **1.5 Target Population**

The target population for each of the three ground sampling programs is described in Table 1.

**Table 1. Landbase area netdown steps used to define each ground sampling program.**

Netdown Description	Deducted Area (ha)			Area after Deductions (ha)			Program
	TFL	TSA	Total	TFL <sup>1</sup>	TSA	Total <sup>2</sup>	
Entire Haida Gwaii Parks <sup>3</sup>		216,800	216,800	158,400	848,400	1,006,800	
Conservancy <sup>4</sup>		247,700	247,700	158,400	383,900	542,300	
Private <sup>5</sup>		22,700	22,700	158,400	361,200	519,600	
Lakes, Wetlands <sup>6</sup>	4,648	50,643	55,291	153,752	310,557	464,309	
<b><i>Operating Area<sup>7</sup></i></b>				<b>153,752</b>	<b>310,557</b>	<b>464,309</b>	<b>CMI</b>
<b><i>Age Breakdown<sup>8</sup></i></b>							
<= 14 years old : all land				6,006	9,930	15,936	
15 - 50 yrs old : all land				51,410	46,841	<b>98,251</b>	<b>YSM</b>
>= 51 yrs old : forested				94,460	242,051	<b>336,511</b>	<b>VRI</b>
>= 51 yrs old : non-forest <sup>9</sup>				1,876	11,735	13,611	
<b><i>Operating Area</i></b>				<b>153,752</b>	<b>310,557</b>	<b>464,309</b>	

## 1.6 Total Program Sample Size

This ground sample plan incorporates increased sampling effort than otherwise applied to other management units. YSM programs normally include a sampling grid size of 5km\*10km, whereas this YSM program doubles the sampling intensity using a 5km\*5km grid.

A total of 120 ground samples will be established across the three programs (Table 2). Since the CMI program falls on the 20km NFI grid, one previously established NFI sample will also be re-measured under the CMI program. The YSM program's 5km grid is a subset of the CMI program, resulting in four common ground samples between the two (CMI & YSM) programs. Therefore, while a total of 124 ground samples are identified across all three programs, 120 will actually be established.

**Table 2. Total sample size by program and land classification.**

	VRI	CMI	YSM	Total
<b>TSA</b>	49	9	15	<b>73</b>
<b>TFL</b>	19	3	24	<b>46</b>
<b>Woodlot</b>	1	0	0	<b>1</b>
<b>Total</b>	<b>69</b>	<b>12</b>	<b>39</b>	<b>120</b>

<sup>1</sup> TFL58 & TFL60 tenure coverage received from D. Louis, Haida Gwaii Forest District Feb. 2016.

<sup>2</sup> Areas are based on the VRI Phase I coverage accessed from GEOBC data warehouse January 2016 (ie., attributes projected to Jan. 2015).

<sup>3</sup> Parks coverage from Tantalis Ownership coverage ver. Jan. 2016 (own=51,60,63).

<sup>4</sup> Conservancy coverage from Tantalis Ownership coverage ver. Jan. 2016 (own=64).

<sup>5</sup> Private and federal lands, and Indian Reserve coverage received from D.Louis, Haida Gwaii Forest District Feb. 2016.

<sup>6</sup> Lakes and wetlands defined from the VRI Phase 1 BCLCS land classification system levels 2 (W) & 3 (W).

<sup>7</sup> For this sample plan, 'Operating Area' is defined as TFLs, TSA, plus woodlot licenses, excluding parks, conservancy areas, private and federal lands, and Indian reserves.

<sup>8</sup> Age is from the VRI Phase 1 rank 1 projected age of the leading species, adjusted to the end of 2015 growth season.

<sup>9</sup> Non-forest includes alpine, rock, herb and low shrub dominated features, and treed polygons less than 10% crown closure as defined in the VRI Phase 1 BCLCS land classification system levels 3 (A) & 4 (BM,BY,EL,HE,HG,RO,SL).

---

## 2.0 MATURE VRI INVENTORY AUDIT PROGRAM

---

### 2.1 Objectives

To audit / evaluate the new 2012-2013 VRI Phase 1 inventory on mature stands, and depending on analysis results recommend adjustments to key inventory attributes.<sup>10</sup>

### 2.2 Target Population

The target population for ground sampling is all forested<sup>9</sup> stands greater than 50 years of age in the Operating Area (336,511), representing 33% of Haida Gwaii and 72% of the operating area (Table 3).

**Table 3. Area netdown summary of Mature VRI Audit target population.**

Netdown Description	Area Deducted (ha)	Area Remaining (ha)	% of Haida Gwaii	% of Operating Area
<b>Entire Haida Gwaii</b>		<b>1,006,800</b>	100%	
Parks / Conservancy / Private	487,200	519,600	52%	
Lakes / Wetlands	55,291	464,309	46%	
<b>Operating Area</b>		<b>464,309</b>	<b>46%</b>	<b>100%</b>
< 15 yrs old	15,936	448,373	45%	97%
15-50 yrs old	98,251	350,122	35%	75%
=> 51 yrs old : non-forested	13,611	336,511	33%	72%
<b>&gt;50yrs old forested (target pop)<sup>11</sup></b>		<b>336,511</b>	<b>33%</b>	<b>72%</b>

### 2.3 Sample Design and Sample Size

VRI phase 1 polygon-based ground samples were randomly selected from the target population, proportional to polygon size with replacement (PPSWR), and pre-stratified by leading species.<sup>12</sup> A total of 69 ground samples are identified, allocated across three leading species strata : 40 in Cw/Yc leading stands, 21 in Hw/Hm leading stands, and 8 in Ss leading plus all other stands (Figure 1).

VRI Mature Audit ground samples are temporary 5-point variable radius clusters, comprising both full measure & count plots. Ground samples will be established as **plot type 'T': Timber-Emphasis plus Succession plots'**. Ground sample establishment and measurements will follow provincial VRI Phase II standards and procedures.<sup>13</sup>

---

<sup>10</sup> The ‘Mature VRI Audit program’ is analogous to previous VRI Phase II ground sample programs, except the source VRI phase 1 inventory is no longer targeted for polygon level attribute adjustments. Rather, adjustment ratios are computed as part of approved analysis methods, and used as justification to apply strata-level adjustments during the TSR process.

<sup>11</sup> Refer to table 1 for netdown definition criteria and coverage sources used.

<sup>12</sup> The procedure “SurveySelect” in SAS was used to select samples using PPSWR. Three species strata were defined from the VRI phase 1 rank 1 leading species, comprising Cw (Cw & Yc), Hw (Hw & Hm), and Ss+ (Ss & all remaining species). The resultant spatial coverage was intersected with the HectaresBC 1ha\*1ha grid, to generate an aspatial dataset for analysis.

<sup>13</sup> Vegetation Resources Inventory Ground Sampling Procedures, Ver. 5.2. Prepared by BC Ministry of Forests, Lands and Resource Management Operations. June 2015.

[https://www.for.gov.bc.ca/hts/vri/standards/RISC/2015/vri\\_ground\\_sampling\\_procedures\\_2015.pdf](https://www.for.gov.bc.ca/hts/vri/standards/RISC/2015/vri_ground_sampling_procedures_2015.pdf).

## **2.4 Decay Sampling**

Cruiser-called net factoring will be assessed as per current VRI ground sampling standards. However, net volume adjustment factor (NVAF) destructive sampling will not be completed, and will instead be replaced by a previous decay sampling project completed during the 1990s.

A design-based volume decay sampling program<sup>14</sup> was completed across all tenures in Haida Gwaii between 1992-1995, totaling approximately 750 destructively sampled trees. While differing from current NVAF sampling protocols, these data nevertheless provide strong unbiased estimates of decay volume for the major tree species in Haida Gwaii. Local decay factors will be developed from this previous sampling program, and will be applied as part of the compilation procedures of the 2016 ground sample data.

## **2.5 Northern Goshawk / Marbled Murrelet Habitat Assessments**

In addition to recording the standard set of wildlife attribute features as part of standard VRI ground sample protocols, successional interpretation will also be completed (plot type 'T'), specifically to assess Northern Goshawk and / or marbled murrelet potential habitat requirements. This will include a field day of training with an onsite specialist at the start of field sampling. Implementation of any other variation from standards will be confirmed prior to commencement of field sampling.

## **2.6 Analysis & Interpretation**

Analysis will follow provincial analysis methods.<sup>15</sup> Opportunities to implement ratio adjustments by strata to the VRI phase 1 coverage will be dependent on sample sizes and resulting significance of ratios. In addition to the 69 mature audit samples, eight of the CMI samples >50yrs old will be included to augment the analysis.

## **2.7 Replacement Samples**

Up to 14 replacement samples, pre-stratified by species, have been selected to provide replacements within a given strata, in the event a given ground sample cannot safely be established.

---

## **3.0 20KM GRID CHANGE MONITORING INVENTORY PROGRAM**

---

### **3.1 Objectives**

To expand the BC Provincial 20km grid monitoring program to also include Haida Gwaii, in support of FAIB's region-wide business needs.

### **3.2 Target Population**

The target population for ground sampling comprises all stands in the Operating Area (464,309ha) representing 46% of Haida Gwaii (Table 4).

**Table 4. Area netdown summary of CMI target population.**

Netdown Description	Area Deducted (ha)	Area Remaining (ha)	% of Haida Gwaii	% of Operating Area
<i>Entire Haida Gwaii</i>		<b>1,006,800</b>	<b>100%</b>	
Parks / Conservancy / Private	487,200	519,600	52%	
Lakes / Wetlands	55,291	464,309	46%	
<i>Operating Area (target pop)<sup>11</sup></i>		<b>464,309</b>	<b>46%</b>	<b>100%</b>

### **3.3 Sample Design and Sample Size**

A total of 12 CMI ground samples will be established on the 20km NFI grid in the Operating Area (Figure 2).<sup>16</sup> Ground samples are circular fixed-area (0.04ha) permanent sample plots. Ground sample establishment and measurement will follow provincial CMI standards and procedures.<sup>17</sup>

### **3.4 Established NFI Plot**

One sample point on the 20km grid was previously established under the Federal NFI monitoring program initiative in 2003. This sample will be re-measured in 2016, and will follow previously established NFI standards.

### **3.5 Analysis**

In addition to addressing FAIB's region-wide business needs, the 20km CMI plots will also be used to augment the YSM program (by an additional 4 samples) and the Mature audit program (by an additional eight samples).

---

<sup>16</sup> While the 20km grid includes a total of 21 grid points across Haida Gwaii, nine samples occurring in parks (6), conservancy areas (2), and private lands (1), will be completed separately as air-photo plot estimates.

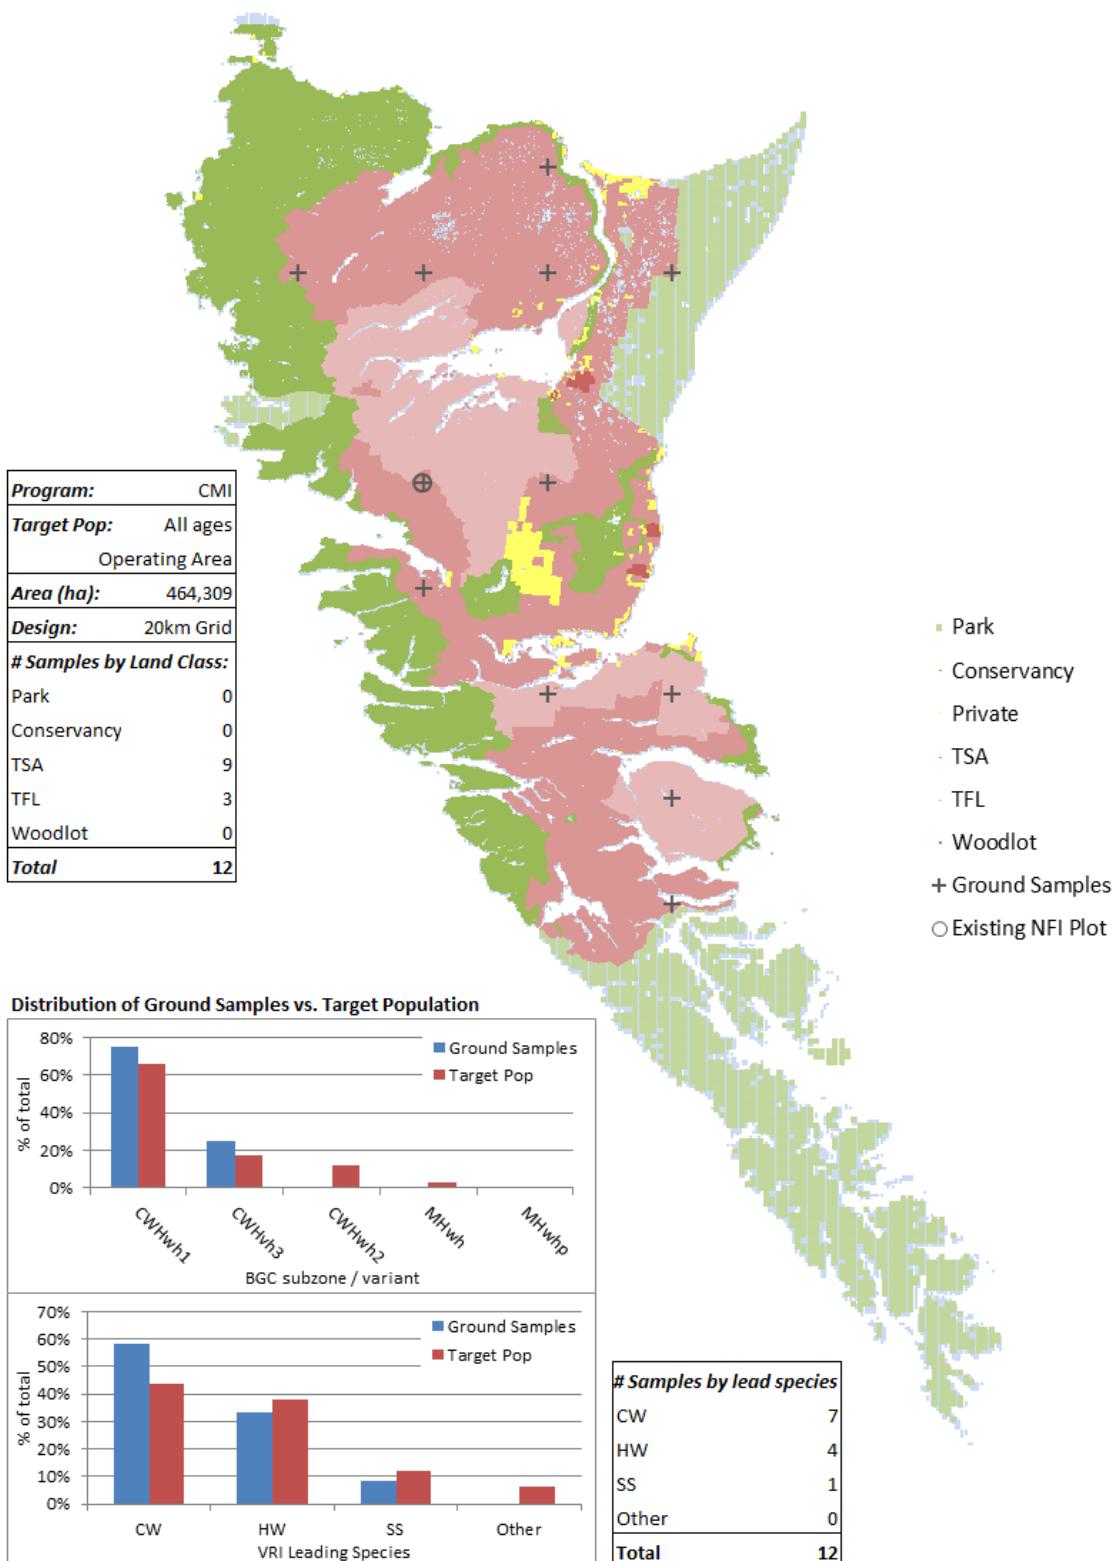

Figure 2. CMI samples on the 20km grid (crosses), plus previously established NFI sample (open circle). Leading species groups (Cw:Cw&Yc, Hw:Hw&Hm, Ss:Ss+other). Operating Area colour-coded in three shades of pink (TFL:light, TSA:medium, Woodlot:dark).

---

## 4.0 YOUNG STAND MONITORING PROGRAM

---

### 4.1 Objectives

To characterize and monitor the growth and yield of young stands, report on forest health conditions, assess accuracy of species mix and site productivity, and compare against growth model projections used in TSR.

### 4.2 Target Population

The target population for ground sampling is all young stands between 15 and 50 years of age in the Operating Area. This age range is used to limit sampling to stands that have merchantable volume and are generally of (but not restricted to) post-harvest origin. The target population will evolve over time as mature stands are disturbed (e.g., by harvesting, fire, blow down, epidemic infestation), subsequently regenerated and attain age 15 years, and as the previously younger stands mature (> 50 years). Young stands total 98,251 ha, representing 10% of Haida Gwaii and 21% of the operating area (Table 5).

**Table 5. Area netdown summary of YSM target population.**

Netdown Description	Area Deducted (ha)	Area Remaining (ha)	% of Haida Gwaii	% of Operating Area
<b>Entire Haida Gwaii</b>		<b>1,006,800</b>	<b>100%</b>	
Parks / Conservancy / Private	487,200	519,600	52%	
Lakes / Wetlands	55,291	464,309	46%	
<b>Operating Area</b>		<b>464,309</b>	<b>46%</b>	<b>100%</b>
< 15 yrs	15,936	448,373	45%	97%
> 50 yrs	350,122	98,251	10%	21%
<b>15-50 yrs (target pop)<sup>17</sup></b>		<b>98,251</b>	<b>10%</b>	<b>21%</b>

### 4.3 Sample Design and Sample Size

The YSM ground samples are located on a 5km\*5km grid that intersects with the target population. The grid is referenced from a sub-division of the National Forest Inventory (NFI) 20km national grid. This results in a total sample size of 43 ground samples, where 4 of the ground samples also overlap as CMI ground samples on the 20km grid (Figure 3).

Ground samples are circular fixed-area (0.04ha) permanent sample plots. Ground sample establishment and measurement will follow provincial YSM standards and procedures.<sup>17</sup>

### 4.4 Black-out Field Sampling Dates

To minimize field sampling within the peak growth period for young stands, YSM samples will have a black-out period defined as June 15 to August 1 during which time no YSM samples will be established. For samples established before June 15, heights will be measured to the top of the previous year's height node. For samples established after August 1, heights will be measured to the top of the current year's height node. This criteria applies to all YSM samples, plus the four CMI samples that overlap as YSM samples.

---

<sup>17</sup> BC Ministry of Forests, Lands and Resource Management Operations. June 2015. Change Monitoring Inventory BC. Change Monitoring procedures for provincial reporting. Ver. 2.2.

[https://www.for.gov.bc.ca/hts/vri/standards/RISC/2015/cmi\\_ground\\_sampling\\_procedures\\_2015.pdf](https://www.for.gov.bc.ca/hts/vri/standards/RISC/2015/cmi_ground_sampling_procedures_2015.pdf).

#### **4.5 Walk-through Method**

The walkthrough method (as specified in the CMI ground sampling standards) will be assessed for all YSM ground samples in proximity to a potential out-of-population polygon boundary. A total of 21 potential walk-through method samples have been identified; however, application of the walkthrough method is a field-based assessment that will be evaluated in the field at each YSM sample location. This criteria applies to all YSM samples, plus the four CMI samples that overlap as YSM samples.

#### **4.6 Analysis & Interpretation**

Analysis will follow standard YSM analysis procedures. Since all 43 ground samples are located on a 5km square grid, the average of all samples will provide an unbiased estimate of the young stand population across the operating area. Depending on sample sizes, post-stratification of the data may also include leading species and / or BGC classification.

First-measurement results can be used to audit inventory attributes of young stands, and include volume, site index, species composition, stand structure, and pest or disease incidence. After the second measurement is completed, differences between measured and predicted growth and yield can be estimated. YSM ground samples will also provide important comparisons against estimates used in and expectations coming from TSR (eg., site index from the provincial site productivity tile, and managed stand yield tables derived from TASS / TIPSY).

#### **4.7 Future Considerations**

The size of the YSM program will increase over time as future recruitment YSM samples enter the minimum age of 15 years. It is estimated an additional 6 or 7 new YSM grid points currently < 15 years old will become part of the target population over the next 15 years.

Ground sample re-measurement intervals will likely be between 5 and 10 years. Older YSM samples leaving the upper YSM age limit will be re-measured at least once in order to assess change.

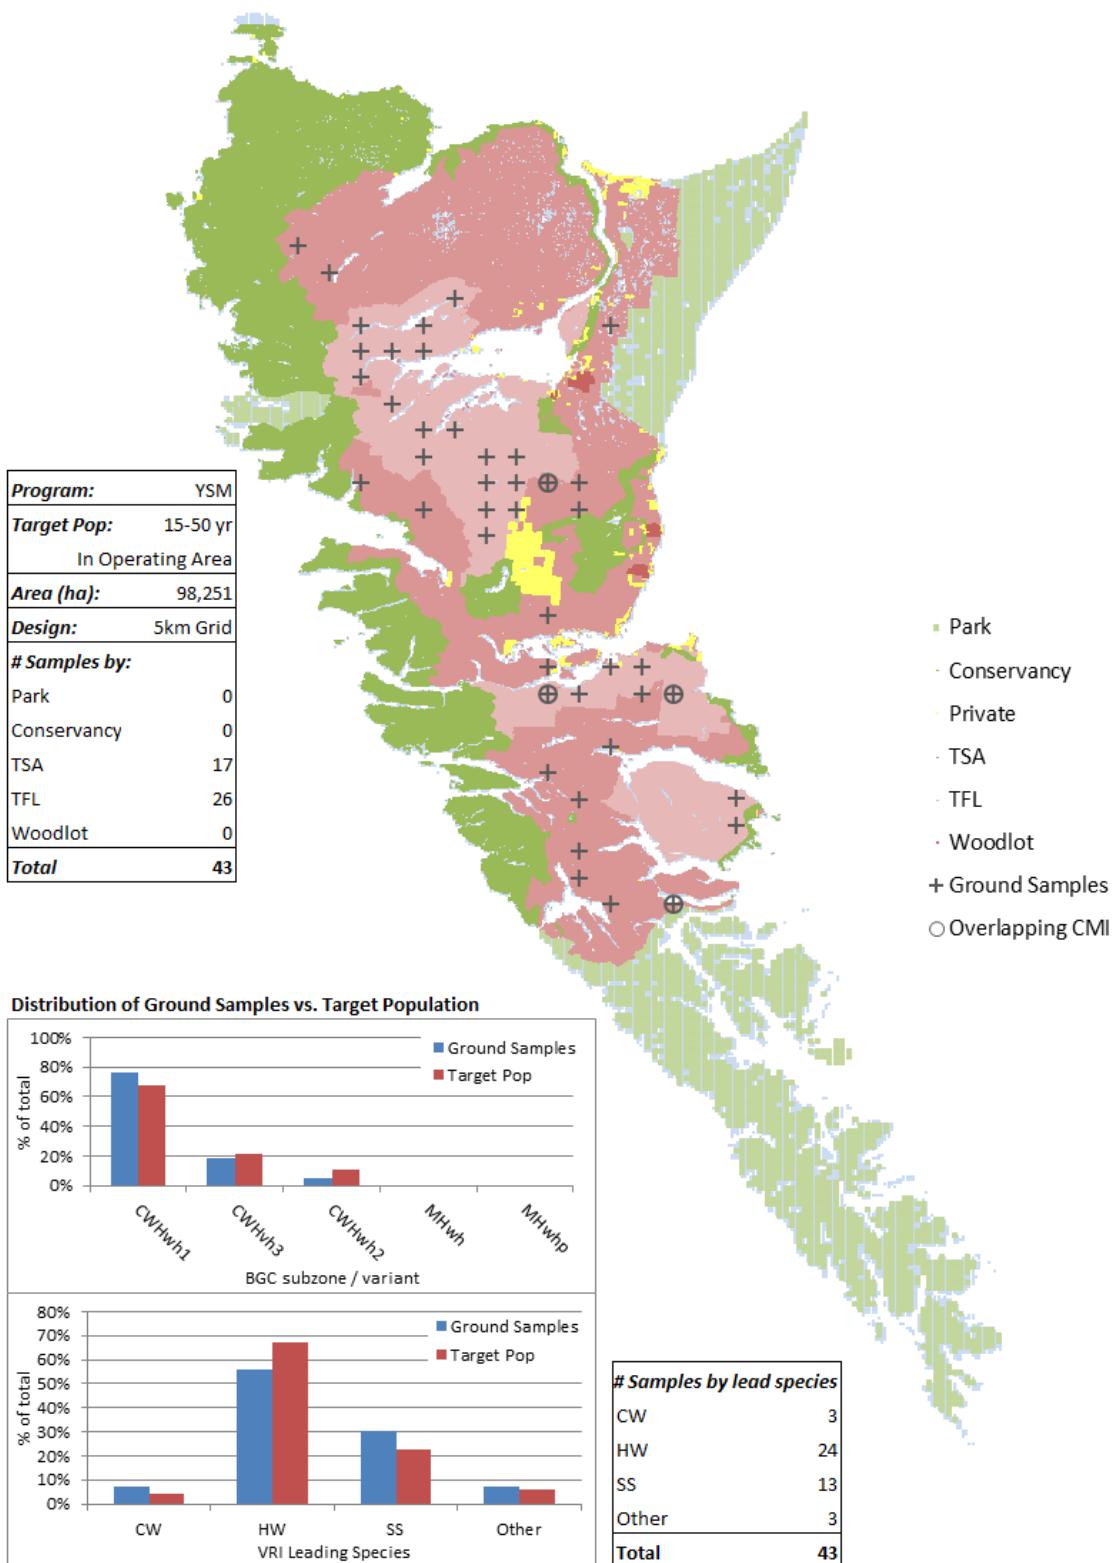

Figure 3. YSM samples on the 5km grid (crosses), plus overlapping CMI samples on the 20km grid (open circle). Leading species groups (Cw:Cw&Yc, Hw:Hw&Hm, Ss:Ss+other). Operating Area colour-coded in three shades of pink (TFL:light, TSA:medium, Woodlot:dark).
