

NOTE

This is an early announcement of an upcoming release of CMS Lite, detailing new features and bug fixes, and may include information about other products. **This is a DRAFT document.** A final version of the release notes will be published, online, on the date of the upgrade.

Product: CMS Lite

Release Number: 2.8.7

Release Date: Sep 11, 2018

What's New?

- Enhancements have been implemented regarding the moving of pages
 - When you move page(s), users who are currently modifying the affected pages will be sent an email about the move
 - Moving a page will no longer change the Modified Date. There are now **two new fields** in the Settings tab to record who moved a page, and when it occurred
 - A move of a page within the same parent will no longer be recorded in the History tab, as they are simply navigation changes within the same parent
 - For SYSADMINS, the Security tab in the Group pane will now indicate the GUID for each page and asset folder listed
 - There are now **four** reports available within CMS Lite for **ALL** users (a "Reports" link is now available in the header)
 - No security is applied to any of these reports. Thus, you will see all activity
 - **Use MS Excel to sort the data as you see fit**
1. **Link Checker:** A report of all (suspected) broken links. It is produced once a month, at the beginning of the month
 2. **Moved pages:** A daily list (produced at 6:00am) of moved pages. The most recently moved page will be found at the bottom of the spreadsheet
 3. **Usage - Assets:** The usage of all assets in QA and PROD. Similar to the Usage tab, but site wide. The list is produced daily at 6:00am
 4. **Usage - Pages:** The usage of all pages in QA and PROD. Similar to the Usage tab, but site wide. The list is produced daily at 6:00am
- Other front and back-end changes have been implemented to improve the application
