WHERE
necks.
and white on their rumps and bodies are usually medium to light brown with shades of gray smaller than elk. Their colouration can vary slightly but their steeper terrain may cause avalanche hazards.
Suitable habitat where foraging is not as efficient or where snowmobiling and skiing may cause caribou to move into less accessible areas. Clumps of trees amongst large open areas in the high country and along roadsides are important to caribou. Mountain Caribou are the most threatened of all caribou in B.C. They no longer live in almost half of their original range and populations have declined.

CARIBOU AT RISK AND WHY?

Certain populations of Woodland Caribou are listed as threatened under the federal Species at Risk Act (SARA). Populations of caribou are legally designated under the British Columbia Forests and Range Practices Act (FRPA). The Ministry of Environment manages certain herds for recovery.

Mountain Caribou are the most threatened of all caribou in B.C. They no longer live in almost half of their original range and populations have declined.

How does snowmobiling affect caribou?

Clumps of trees amongst large open areas in the high country of the Interior Wet Belt are ideally suited for Mountain Caribou, as well as for various types of skiing and snowmobiling.

- Snowmobiling and skiing may cause caribou to move into less suitable habitat where foraging is not as efficient or where steeper terrain may cause avalanche hazards.
- Unnecessary movements of caribou may also deplete their energy reserves during critical time periods.
- Packed trails can provide easier access for predators to move into areas occupied by caribou.
- Northern Caribou populations are also susceptible to disturbance from recreational activities.

This brochure was produced jointly by the B.C. Ministry of Environment and the BC Snowmobile Federation. Funding was provided by the Government of B.C.
All caribou in British Columbia are Woodland Caribou; they are further divided into three ecotypes depending on feeding and movement behaviour:

**MOUNTAIN CARIBOU** live in the Interior Wet Belt that stretches from northern Idaho and Washington to an area north of Prince George. They are different from other caribou because in winter they survive by eating lichens that grow on trees. This trait allows them to live in this deep snow zone as they do not have to dig through snow for ground lichens as do other caribou.

**NORTHERN CARIBOU** live in the west central and northern parts of B.C. and in parts of Alberta. During the winter they feed on lichens that grow on the ground, digging through the snow when necessary. They usually choose low elevation pine forests or wind-swept ridges where the snow is less deep.

**BOREAL CARIBOU** live in the low elevation flatter areas of muskeg and open forests in northeastern B.C., north of Ft. St. John. Their range also extends across the northern boreal forests of much of Canada. Ground lichens are their main winter food.

Before you snowmobile in an area, find out if it might be used by caribou. The map shows the general areas where caribou live in B.C.

Find out if there are snowmobile closures in the area where you intend to snowmobile. The contacts listed in this brochure can provide local information. Many closures are regulated under the Wildlife Act; details and maps for these closures are in the Hunting and Trapping Synopsis, which can be obtained free at many sporting goods stores and on the web at:

http://www.env.gov.bc.ca/fw/wild/synopsis.htm

- Ride in areas designated for snowmobiling; do not ride in closed areas. Many closures are marked, so please obey all posted signs.
- If caribou are encountered on a road or designated trail, turn off the engine and wait until the caribou have moved off the road or trail before continuing, making every effort to stay as far away from the caribou as safely possible.
- If caribou are encountered in a play area, do not approach them and shut down your machines to give animals a chance to move away. Then, leave the area and refrain from riding within sight of the caribou.
- Taking photographs is okay if from a distance.
- If caribou tracks are observed, do not follow the tracks.

The potential for harming other wildlife and plants can be reduced by the following:

- Do not approach, follow, or harm any wildlife.
- To avoid damaging vegetation, ride only where the snow is greater than 30 cm deep.
- Bring out everything that you bring in.
