TERRAIN DATABASE MANUAL, STATUS

GIS Specifications: Section 4 contains updated information on the 'Digital data specifications for terrain mapping in GIS', in both ARC/INFO and IGDS. For further information, contact the Terrain Data Custodian, see Appendix 1.

Labeler Routine: At this time the labeling algorithm is not going to be undertaken due to maintenance concerns. As well, many Geographic Information System (GIS) firms have developed their own labeling algorithms. Users are encouraged to 'phone around' and inquire on purchasing or leasing labeling software. Recorded at the rear of Section 6, are examples of terrain polygon symbols suitable for (GIS) plotting.

Data Capture:
(data entry screen) Terrain polygon data entry screen has now been developed, this application works with this run-time MS-Access version 2.

The URL is

<http://www.env.gov.bc.ca/rib/wis/terrain/inventory/capture.htm>

Note: Use of this particular application is not always mandatory, people can develop their own (more efficient) data entry screens as long as the rules in this manual are followed.

For further information contact the Terrain Data Custodian, see Appendix 1.

Internet Web
Server: To maintain contact with the Terrain Data Custodian, see Appendix 1 and inquire as to the posting of a manual announcement page, and the proposed FAQ page.

PREFACE

The Terrain Database manual is a functional part of British Columbia's approach to terrain, slope stability and bioterrain* mapping. It is intended to be used in conjunction with the following documents.

- *Terrain Classification System For British Columbia. Version 2.0.* 1997. D. E. Howes and E. Kenk. Victoria
- *Guidelines and Standards for Terrain Mapping in British Columbia.* RIC, January, 1996.
- *Mapping and Assessing Terrain Stability Guidebook.* (1995) and newer editions in process.
- **Standard for Terrestrial Ecosystem Mapping (TEM) in British Columbia* (1995) – (1998 in process) bioterrain mapping is a part of (TEM) mapping procedures and will be a part of the (TEM) data warehouse.

This manual sets out the procedures and rules for the digital capture, storage and delivery of terrain data (symbolized polygon data) for GIS (Geographic Information Systems) and Database systems. The goal is to capture, store and distribute data in an organized manner throughout the province and commensurate with the objectives of the Resources Inventory Committee (RIC).

The Terrain Database Working Committee compiled this manual under the auspices of the Surficial Geology Task Group of RIC. The Database Committee consists of geoscientists and computer mapping experts from the consulting community and government agencies, meeting since October 1995.

As a part of the data manual, new terms and codes were added to the current *Terrain Classification System for British Columbia*, Howes and Kenk, Version 2.0. Howes and Kenk, Version 2.0 records all changes and additions made to date. This manual contains most of the terms required for completing the Terrain Data Form. The additional data such as slope and erosion classes comes from Forest Practices Code Terrain Guidebooks and (RIC) Terrain documents. This data is used for interpretations such as slope stability and potential erosion used to meet the requirements or terrain mapping. This manual follows all Terrain and RIC related documents, particularly the mapping and classification manuals.

The funding was provided by Corporate Resource Inventory Initiatives (CRII), Forest Renewal British Columbia (FRBC) and Resource Inventory Committee (RIC).

The compilation of this Terrain Database Manual draws heavily upon E. Kenk et al 1987, *Computer Assisted Planning Assessment and Map Production* (CAPAMP), volume 1 (1987). The CAPAMP manual documented the data entry and validation procedures for a thematic-mapping GIS, covering soil, agriculture capability, surficial geology and the all purpose entity. More modern GIS and database systems have replaced the CAPAMP system, and this *Terrain Database Manual* supersedes the CAPAMP document.

Users should be aware of the Digital Data Specification Standard, Resources Inventory Committee, Digital Data Working Group, Version 1, 1997.

1. Introduction

1.1 Purpose and directives

The purpose of this document is to give concise, detailed information on compiling digital data for terrain mapping. This manual was written to facilitate terrain digital data storage and delivery. It includes data standards for terrain, terrain stability, and terrain-ecosystem mapping, to ensure terrain resource data entry for storage and access occurs in a systematic manner throughout the province. It is intended that, these data, including maps, polygon data, metadata, and legends, are suitable for digital data exchange among business, government, the research community, and the general public.

The aim of the terrain database is to provide mappers, contractees, government custodians, and other users with consistent criteria for terrain data management. Forest Renewal BC is funding a project to centrally store digital terrain data, to facilitate its automated distribution by computer. We anticipate that government-funded mapping projects will comply with the recommended use of RIC sanctioned documents. These will provide mappers, correlators and data managers, whether in the Districts, Regions or in Provincial custodian offices, with consistent terms of reference. The Terrain Database Working Committee will aim to keep this manual up to date through annual reviews of concerns and procedures to address future implementation requirements. It is recognized there will be some start-up problems and concerns with the standards.

Provincial terrain correlators will be available for consistent help and direction. As well, regional geomorphologists and GIS managers should also provide guidance and direction on the use of all Terrain related documents. A list of the current government geomorphologists and data managers (GIS) is provided at the end of this document.

For more detailed information on the rationale and the intentions of the use of GIS (Geographic Information Systems), see the Introduction of section 4.

Note: We strongly advise seeking guidance from the original terrain mapper in the preparation of interpretive products and/or manipulation of the terrain maps and databases. The database omits some aspects of terrain (for example, various subtypes of materials), so that applying generic algorithms may result in misleading information.

Note: This manual is designed to be comprehensive and prepared and is constructed to cover most terrain data collected in BC. As such, the manual does not cover which terrain attributes should be collected for a particular mapping project - that is the subject of a 'contract requirement' and the mapping methodology. The contract should specify which terrain attributes are required.

1.2 Scope and status of the manual

This manual has been through a developmental stage for last two years. This manual does not cover all aspects of digital terrain data capture associated with mapping, such as on-site engineering reports or data logging of deep sections.

This manual, to date, includes:

1. Data entry procedures for basic terrain polygon data capture classification, as applied to terrain and terrain stability mapping;
2. Basic standards for GIS (ARC/INFO and IGDS) data storage;
3. Symbology for feature codes (on-site symbols) - Features codes and definitions for ARC/INFO symbology have been developed. Some feature codes can be acquired from the web URL http://www.env.gov.bc.ca:8000/feature_code/owa/fcode.formquery

This manual does not include:

1. Any procedures with regard to the terrain warehousing strategy.
2. Standards and procedures for map legends; see web site information at the Ministry of Energy Mines, Geological Survey Branch or Ministry of Environment, Resources Inventory Branch.
3. The logical data model for the storage of digital terrain mapping data can be acquired from the **Terrain Data Custodian, see Appendix 1.**

This manual supersedes portions of RIC's *Guidelines and Standards for Terrain Mapping in British Columbia* (1995), Appendix F, 'Digital Database'. For further information on the use of certain data entities, contact the **Terrain Data Custodian, see Appendix 1** at the British Columbia Geological Survey Branch, Victoria, tel. (250) 952-0422.

1.3 How to use the procedures for polygon data entry

Note 1: The following procedures assume a basic familiarity with terrain mapping concepts:

Note 2: Terrain polygon data entry screen has now been developed (DC), this application works with run-time MS-Access version 2.

The URL is <http://www.env.gov.bc.ca/rib/wis/terrain/inventory/capture.htm>

1. Review the Terrain Polygon Data Form in section 3, which illustrates the attributes listing. These are core attributes¹ for terrain data capture and provincial storage. You can enter non-core terrain data in the project-specific section of the form, but it will be stored and managed only in flat files. Section 3 also contains a sample data form with a set of terrain symbols and codes, which serve as examples for data entry procedures.

2. Review section 2.2, 'Field Definitions for the Terrain Data Form'. This table gives field names, allowable field lengths, and character types for each attribute. Strict adherence to the codes is necessary as validation routines will later be run against the databases. Faulty coding will require time-consuming corrections. To assist mapping contractors with capturing polygon attributes, the terrain data capture application is now available. The application will be at our web site (see page ii) in a self extracting zipped format for download efficiency. Once installed, contractors are able to capture all polygon attributes with business rules enforced and validation performed. Attributes can be exported in a database format for loading into whichever proprietary GIS the contractor uses.
3. Review section 2.3, 'Codes, names and definitions'. These tables define most of the terrain terms, including new terms added to the terrain classification system. They are the complete list of current terrain mapping codes.
4. Section 4, 'Digital Data Specification for Terrain Mapping in GIS',. This section of the document specifies format and content standards for storing terrain surficial geology data in ARC/INFO IGDS format.
5. If you are unfamiliar with the terrain mapping system, refer to the manuals listed in 'References'. For a summary refer to the web site <http://www.env.gov.bc.ca/> Also, contact the **Terrain Data Custodian, (Appendix 1)** for the address of their web site (currently under development).

Note: Any field data form or database program may be used for field data capture, data entry or short-term storage, but the data *must* follow the defined standards and *must* be submitted in one of the standard forms: as an as a comma separated values (CSV) file. Table 2-1 presents the standards that accompany the fields and names of the data form.

Optionally, a contractor may use only certain attributes in the database for their particular project, but the coding in the database must still adhere to all standards provided in the database procedures in order to ensure consistency of data. The field length, the field description, and the comments on special characters or formats are provided where applicable.

Note: core attributes¹: are those specified as a minimum data set required for a particular mapping methodology; those attributes are, or will be, discussed in each (RIC) mapping methodology. Core attributes are ones which the (RIC) committees will undertake to manage, storage and distribute as corporate data. Each mapping contract should also stipulate which are the core items to be collected for that project, and which are additional attributes.

With reference to the 'Terrain Data Form', each type of terrain project (for example general terrain, slope stability, or mineral potential) will have its own 'somewhat' unique set of terrain attributes. Therefore, not all attributes, on this form, will necessarily be used for any one project.

1.3.1 Project Metadata (project records)

There are two types of project metadata. One is a record of field mapping information in the header of the Terrain Data Form. The other is a listing of GIS specifications related to spatial digital files recorded in section 5 (see also page iii). The final requirements for metadata are still under development. All data sets submitted to any government repository at the end of a project or contract must include metadata.

1.3.2 Unique polygon identification

Each polygon must have a unique identifier. Preferably, this identifier should combine the project identifier (id) and polygon number. Alternatively, it can also include a combination of mapsheet number and polygon number. To fill out mapsheet number follow guidelines in 'Describing Ecosystems in the Field', as in Table 1-1.

Note: Do not use the MoF 20 chain mapsheet delineation.

Table 1-1 - Map Number Recording Convention

MAP SERIES	MAPSHEET #	
NTS series or BCGS series - 1:125 000 or 1:100 000 scale		
92F/NW	1:250	<u>1</u> <u>0</u> <u>3</u> E <u>N</u> <u>W</u> _
NTS series or BCGS series - 1:50 000 scale and larger		
NTS series- 92F/4E	1:50	_ <u>9</u> <u>2</u> E _ <u>4</u> E _
BCGS series - 1:20 000 scale 92F.057	1:20	_ <u>9</u> <u>2</u> E <u>0</u> <u>5</u> Z _
BCGS series - 1:10 000 scale 92F.057.2	1:10	_ <u>9</u> <u>2</u> E <u>0</u> <u>5</u> Z <u>2</u>

2. Completing the Terrain Data Form

2.1 Conventions

This section of the document defines the conventions used in Table 2-1 and provides a detailed field description. An example of a 'data form' in Excel format is in Section 3, for terrain data capture application, see page ii for http site address.

The following description of allowable codes and fields relate to data entry procedures when used on a variety of terrain polygon databases. They apply to all terrain, slope stability and terrain data or a part of terrestrial ecosystem mapping and to some project specific codes.

2.1.1 Field Length

The maximum number of characters which may be entered for a given item. There are two general modes, shown by the following examples.

- 4** A 4-character field, no implied data type.
- 6,2** 6-character field, numeric data implied, with three characters preceding the decimal point and two characters following (the decimal point counts as a character). The number 1 2 3 . 1 2 has a field length of 6,2.

2.1.2 Type

A reference to one of the following three categories of data.

- n** *Numeric characters.* These are the ten digits 0–9, plus decimal points and leading blanks, for example, 1 0 and 0 1 0 are equivalent. (The entry 1 is not allowed). After the decimal use zeroes, not blanks. Decimals must be entered to the required precision. (For example if the standards specify data in tenths of units, enter 10 cm as 1 0 . 0).
- a** *Alphabetic characters.* These are the twenty-six letters of the alphabet plus the blank character.
- an** *Alphanumeric characters.* These include all numeric and alphabetic characters.
- c** *All possible characters.* These include numeric, alphabetic characters and special characters, such as / ' ; - =

2.1.3 Format

A reference to one of the following two categories of data storage.

- x** *Fixed* - the position of each character of the data element is directly connotative. All numeric entries for example are fixed. Fixed format data can be readily used in sorting or analytic procedures. Specific edit procedures can usually be established for fixed format data.

- e** *Free* - the position of each character of the data element is *not* connotative. All 'comments' and 'notes' entries are free. Free-format data may appear in a report or description of a site but usually is not easily used in sorting or analytic procedures. Specific edit procedures usually *cannot* be established for free format data. (Exception: for Terrestrial Ecosystem projects, a certain number of the leading characters of a free format entry may be considered as fixed if special arrangements are made with the systems analyst in the Wildlife Inventory Section of the Resource Inventory Branch. Thus, with certain modifications, mineral potential or soil compaction ratings for example may be entered as fixed format data in fields that would be designated a 'comments' or 'notes' item).

2.1.4 Justification

A reference to one of the following two forms of data entry.

- l** *Left justified*. The data is entered in the left-hand most part of the field. If for example the field length is 6 and the letters to be entered are ACK, then left justification would appear as follows: A C K . Normally, alphabetic characters are left justified.

- r** *Right justified*. The data is entered in the right-hand most part of the field. Right justification would appear as follows: 1 1 5 . Normally, numeric characters are right justified.
Fields which require a decimal are always right justified for the decimal part of the number. In this case the decimal part of the number must always be completed; thus, a slope of five percent would be entered as 5.0 .
Alphanumeric characters are right justified. See Table 2-1.

2.1.5 Case

A reference to one of the following two forms of character.

- u** *Uppercase*. The data must appear in uppercase characters. Uppercase characters would appear as follows: CWH

- l** *Lowercase*. The data must appear in lowercase characters. Lowercase characters would appear as follows: dx

2.1.6 Field Description

The Field Description includes the 4 specification parts: type, format, justification, and case (where type is character) as shown by the example: c-x-l-l indicates -character data- of a -fixed format-, -left justified- and -lowercase- note, lowercase will always be in the fourth position. Numeric fixed entries with decimals are right justified and filled with zeroes on the right, as discussed above; a case code is not given for them in the tables which follow.

2.2 Field Definitions

In Table 2-1, items 1 through 14 refer to the Terrain Polygon Metadata fields (project data) and items 15 through 105 refer to the descriptions of Terrain Polygon Data fields (terrain classifications). Refer to the form layout in section 3. Except for the mapsheet number, these attributes must be consistent throughout a terrain mapping project, and need only be provided once for the entire project. The project number and/or name should be entered on every form in order to keep the project data forms or records together. Where the terrain polygons are being mapped on a mapsheet basis, the mapsheet number should be filled in. If the polygons are being mapped *and* numbered on a mapsheet/project basis, the mapsheet number *must* be filled in, and every polygon on the data form must fall on the specified mapsheet.

The last column shows the name of the corresponding attribute in the comma-separated values (CSV) file for the CSV Terrain Data (Format) Deliverable.

Some fields require the mapper to choose from a specific set of values. The description column for each of these fields indicate the code table to use. Lists of valid codes for each field are given in section 2.3, 'Codes, names and definitions'.

- Table 2-2 provides instructions on recording text in the header of the terrain dataform (for example, legend types and sources).
- Table 2-3 provides codes and terms for identifying the terrain survey intensity level.
- Table 2-4 through Table 2-30 provide terms and codes related to standardized terrain classification.

Table 2-1 - Description of Terrain Mapping Project Data

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
Note: The first 14 items refer to the metadata in the header of the Terrain Polygon Data Form.					
1	Project Name	The common name of the project, usually a well known local place or feature. See Table 2-2.	40	c-e-l	Proj_Name
2	Geographic Location	The geographic area of the mapping project. See Table 2-2.	40	an-e-l	Geog_Loc
3	Consultant/ Department	The government department or private sector company that is responsible for the current terrain mapping project. See Table 2-2.	40	c-e-l	Org_Name
4	Mapper Name	The geologist or geomorphologist who is doing the mapping. Where there is more than one mapper working on a project, the name of the project leader. See Table 2-2.	30	c-e-l	Mapper
5	Legend Type(s)	The type of legend associated with the map; refer to the <i>Terrain Mapping Methodology</i> (RIC) for legend format and specifications. Indicate one of the following with an 'x': General, Short, Terrain stability, Other/Custom. See Legend Type Code Table, Table 2-2.	3	c-x	Leg_Type
6	Legend Source	The origin of a customized legend. See Table 2-2.	50	c-e-l	Leg_Src
7	Map Scale	The scale on which the original terrain polygons were captured. See Table 2-2.	8	n-e-r	Scale
8	Terrain Survey Intensity Level	The extent to which the terrain mapping for the current project has been checked on the ground. See Table 2-3.	1	a-x-u	Tsil
9	Date Surveyed	The date on which the terrain mapping for the project was completed. Format: <i>dd-mmm-yy</i> . See Table 2-2.	9	c-x-r	Surv_Date
10	Date Recorded	The date on which of the project and polygon mapping was completed and entered into a Database. Format: <i>dd-mmm-yy</i> .	9	c-x-r	Rec_Date
11	Recorder Name	The person who originally entered the terrain map data electronically.	30	c-e-l	Rec_Name
12	Slope Units	The type of units, if slope classes were done for this database, percent or degrees denoting slope steepness. The same units must be used for all slope steepness values in a given project. Indicate one of the following with a (P) Percent, (D) Degrees or (N) Null. See Table 2-2 and See Table 2-17.	1	c-x-l	Slp_Unit
13	Stability. Classification Type	The classification system used to classify slope stability for the current project. Indicate only one of the following with an (R) Recon, (D) Detailed, or (E) Es. See Tables 2-18 - 2-20.	1	c-x-l	Stbcls_Tp
14	Comments	This field may be used to record any pertinent information regarding the project. At all times attempt to use referenced classifications which are well defined and understood in the science, or provide thorough definitions for the user. This project specific data will be stored in flat file format, unless keyword or standard designations are required, then contact the data custodian. The data custodian will keep records of new or additional classifications, which are commonly used for project specific applications.	300	c-e-l	Comments

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
Note: Items 15 through 105 refer to the attributes on the Terrain Polygon Data Form.					
15	Polygon Number	An identifier each polygon being mapped. Polygons may be numbered within projects or within projects and mapsheets, depending on the preference of the lead mapper.	8	n-e-r	Poly_Nbr
16	Project Identification	A unique identifier for each project being delivered within a single contract. If only one project is being delivered, no project identifier is required. This variable allows any mapping metadata (TSIL for example) to be specified for the project as a whole. See section 4 and Table 2-2.	5	an-x-l	Proj_ID
17	Mapsheet Number	Where the project mapping falls entirely within a single mapsheet, the number of the mapsheet. See Table 1-1.	9	an-x-l	Mapsh_Nbr
18	Decile of Terrain Component 1	Describes the proportion of the polygon covered by Component 1, in deciles. Note: The deciles of Components 1–3 must total 10 (i.e., 5–3–2 or 6–4, if the first two deciles total 10 then the third decile is not filled out). Decile 1 must be greater or equal to decile 2, which must be greater or equal to decile 3. No decile = 100% (1st component only). See Table 2-14.	2	n-x-r	Tdec_1
19	Partial Cover Flag of Component 1	A single slash '/' indicates that the overlying material in the terrain component only partially covers the underlying material. It means a moderately extensive but discontinuous cover of surface material. Eolian veneer is an example. <i>Note this is a new term added to the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>	1	c-x-l	Prtflg_1
20	Surficial Material Texture of Component 1	The standard terrain texture at the surface. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the first stratum of the terrain component 1 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Ttex_1
21	Surficial Material of Component 1	The formative geomorphological process of the first stratum of surficial material of component 1 of the current terrain polygon. See Table 2-6.	2	c-x-l-u	Surfm_1
22	Surficial Material Qualifier of Component 1	A code used to specify whether the formative geomorphological process of the first stratum of surficial deposit of component 1 is currently 'active' ('A') or 'inactive' ('I'). The assumed status is not recorded. Note: 'G' is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Surfm_Q1
23	Surficial Material Subtype of Component 1	A project-specific code for the subtype of the surficial material in the first stratum of the component of the current terrain polygon. A surficial material subtype is distinguished by characteristics that cannot be adequately represented by standard terrain classes. See Table 2-29.	1	n-x-r	Surfm_St1

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
24	Surface Expression of Component 1	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the first stratum in the component of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Surf_E1
25	Bedrock Type of Component 1	The type of bedrock in the terrain component. (This is only applicable where surficial material is of origin type 'R'). See Table 2-4. <i>These bedrock classes are new to the Terrain Classification System.</i> The intent of using the bedrock code is to provide auxiliary information, as to help qualify texture and/or terrain stability information. It is not intended to provide bedrock stratigraphy.	2	c-x-l-l	Bedrock_1
26	Subsurficial Material Texture of Component 1	The standard terrain texture at the first subsurface stratum. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the first stratum of the terrain component 1 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Sttex_1
27	Subsurficial Material of Component 1	A code representing the formative geomorphological process of the first subsurface stratum of surficial material of the first component of the current terrain polygon. Note: There is now provision for the coding of two subsurface materials, for each component in this database. It is expected however that the bulk of the (RIC) mapping will only use two strata. For the mapping of deep stratigraphy the user will have to modify and/or create a custom database. See Table 2-6.	2	c-x-l-u	Ssurfm_1
28	Subsurficial Material Qualifier of Component 1	A code used to specify whether the formative geomorphological process of the subsurficial stratum of surficial deposit of component 1 is currently 'active' ('A') or 'inactive' ('I'). The assumed status is not recorded. Note: 'G' is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Ssurfm_Q1
29	Subsurficial Material Subtype of Component 1	A project-specific code that indicates a subclass of the genetic material in the second stratum of component 1 of the current terrain polygon. A surficial material subclass is distinguished by characteristics that cannot be adequately represented by the standard surface material origin classes. See Table 2-29.	1	n-x-l	Ssurfm_St1
30	Subsurface Expression of Component 1	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the second stratum in component 1 of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Ssurf_E1

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
31	Sub-Subsuficial Material Texture of Component 1	The standard terrain texture at the Sub-subsurface. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the third stratum of the terrain component 1 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Tttx_1
32	Sub-Subsuficial Material of Component 1	The formative geomorphological process of the Sub-substratum of surficial material of component 1 of the current terrain polygon. See Table 2-6.	2	c-x-l-u	Tsurfm_1
33	Sub-Subsuficial Material Qualifier of Component 1	A code used to specify whether the formative geomorphological process of the first stratum of surficial deposit of component 1 is currently 'active' ('A') or 'inactive' ('I'). The assumed status is not recorded. Note: 'G' is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Tsurfm_Q1
34	Sub-Subsuficial Material Subtype of Component 1	A project-specific code for the subtype of the surficial material in the Sub-substratum of the component of the current terrain polygon. A surficial material subtype is distinguished by characteristics that cannot be adequately represented by standard terrain classes. See Table 2-29.	1	n-x-r	Tsurfm_St1
35	Sub-Subsurface Expression of Component 1	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the Sub-substratum in the component of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Tsurf_E1
36	Relation of Component 1 and 2	A general indicator of the relative areal proportions of the first and second components within the current terrain polygon. (Note - These proportional indicators are frequently used in place of percentiles. Bioterrain mapping however usually specifies the use of percentiles). See Table 2-14.	2	c-x-l	Comrel1_2
37	Decile of Terrain Component 2	Describes the proportion of the polygon covered by Component 2, in deciles. Note: The deciles of Components 1–3 must total 10 (i.e., 5–3–2 or 6–4, if the first two decile total 10 then the third decile is not filled out). Decile 1 must be greater or equal to decile 2, which must be greater or equal to decile 3. The dominant component of surficial material(s) in a terrain polygon; designated by a decile, (8 means 80%; no entry means 100%) See Table 2-14.	2	n-x-r	Tdec_2
38	Partial Cover Flag of Component 2	A single slash '/' indicates that the overlying material in the terrain component only partially covers the underlying material. Eolian veneer is an example. <i>Note this is a new term added to the Terrain Classification Manual, Howes and Kenk, Version 2.0.</i>	1	c-x-l	Prtflg_2

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
39	Surficial Material Texture of Component 2	The standard terrain texture at the surface. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the first stratum of the terrain component 2 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Ttex_2
40	Surficial Material of Component 2	The formative geomorphological process of the first stratum of surficial material of component 2 of the current terrain polygon. See Table 2-6.	2	c-x-l-u	Surfm_2
41	Surficial Material Qualifier of Component 2	A code used to specify whether the formative geomorphological process of the first stratum of surficial deposit of component 2 is currently ‘active’ (‘A’) or ‘inactive’ (‘I’). The assumed status is not recorded. Note: ‘G’ is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Surfm_Q2
42	Surficial Material Subtype of Component 2	A project-specific code for the subtype of the surficial material in the first stratum of component 2 of the current terrain polygon. A surficial material subtype is distinguished by characteristics that cannot be adequately represented by standard terrain classes. See Table 2-29.	1	n-x-r	Surfm_St2
43	Surface Expression of Component 2	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the first stratum in the component of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Surf_E2
44	Bedrock Type of Component 2	The type of bedrock in the terrain component. (This is only applicable where surficial material is of origin type ‘R’). See Table 2-4. <i>These bedrock classes are new to the Terrain Classification System.</i> The intent of using the bedrock code is to provide auxiliary information, as to help qualify texture and/or terrain stability information. It is not intended to provide bedrock stratigraphy.	2	c-x-l-l	Bedrock_2
45	Subsurficial Material Texture of Component 2	The standard terrain texture at the first subsurface stratum. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the first stratum of terrain component 2 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Sttex_2

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
46	Subsurficial Material of Component 2	A code representing the formative geomorphological process of the first subsurface stratum of surficial material of component 2 of the current terrain polygon. Note: There is only provision for the coding of one subsurface material, for each component in this database. For the mapping of stratigraphy the user will have to modify and/or create a custom database. See Table 2-6.	2	c-x-l-u	Ssurf_m_2
47	Subsurficial Material Qualifier of Component 2	A code used to specify whether the formative geomorphological process of the subsurficial stratum of surficial deposit of component 2 is currently 'active' ('A') or 'inactive' ('I'). The assumed status is not recorded. Note: 'G' is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Ssurf_m_Q2
48	Subsurficial Material Subtype of Component 2	A project-specific code that indicates a subclass of the genetic material in the second stratum of component 2 of the current terrain polygon. A surficial material subclass is distinguished by characteristics that cannot be adequately represented by the standard surface material origin classes. See Table 2-29.	1	n-x-r	Ssurf_m_St2
49	Subsurface Expression of Component 2	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the second stratum in component 2 of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Ssurf_E2
50	Sub-Subsurficial Material Texture of Component 2	The standard terrain texture at the Sub-subsurface. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the third stratum of the terrain component 2 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Tttx_2
51	Sub-Subsurficial Material of Component 2	The formative geomorphological process of the Sub-substratum of surficial material of component 2 of the current terrain polygon. See Table 2-6.	2	c-x-l-u	Tsurf_m_2
52	Sub-Subsurficial Material Qualifier of Component 2	A code used to specify whether the formative geomorphological process of the first stratum of surficial deposit of component 2 is currently 'active' ('A') or 'inactive' ('I'). The assumed status is not recorded. Note: 'G' is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Tsurf_m_Q2
53	Sub-Subsurficial Material Subtype of Component 2	A project-specific code for the subtype of the surficial material in the Sub-substratum of the component of the current terrain polygon. A surficial material subtype is distinguished by characteristics that cannot be adequately represented by standard terrain classes. See Table 2-29.	1	n-x-r	Tsurf_m_St2

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
54	Sub-Subsurface Expression of Component 2	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the Sub-substratum in the component of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Tsurf_E2
55	Relation of Component 2 and 3	A general indicator of the relative areal proportions of the second and third components of the current terrain polygon. See Table 2-14.	2	c-x-l	Comrel2_3
56	Decile of Terrain Component 3	Describes the proportion of the polygon covered by Component 3, in deciles. Note: The deciles of Components 1–3 must total 10 (i.e., 5–3–2 or 6–4, if the first two deciles total 10 then the third decile is not filled out). Decile 1 must be greater or equal to decile 2, which must be greater or equal to decile 3. The dominant component of surficial material(s) in a terrain polygon; designated by a decile, (8 means 80%; no entry means 100%)	2	n-x-r	Tdec_3
57	Partial Cover Flag of Component 3	A single slash '/' indicates that the overlying material in the terrain component only partially covers the underlying material. Eolian veneer is an example. <i>Note this is a new term added to the Terrain Classification Manual, Howes and Kenk, Version 2.0.</i>	1	c-x-l	Prtflg_3
58	Surficial Material Texture of Component 3	The standard terrain texture at the surface. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the first stratum of the terrain component 3 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Ttex_3
59	Surficial Material of Component 3	The formative geomorphological process of the first stratum of surficial material of component 3 of the current terrain polygon. See Table 2-6.	2	c-x-l-u	Surfm_3
60	Surficial Material Qualifier of Component 3	A code used to specify whether the formative geomorphological process of the first stratum of surficial deposit of component 3 is currently 'active' ('A') or 'inactive' ('I'). The assumed status is not recorded. Note: 'G' is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Surfm_Q3
61	Surficial Material Subtype of Component 3	A project-specific code for the subtype of the surficial material in the first stratum of component 3 of the current terrain polygon. A surficial material subtype is distinguished by characteristics that cannot be adequately represented by standard terrain classes. See Table 2-29.	1	n-x-r	Surfm_St3

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
62	Surface Expression of Component 3	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the first stratum in the component of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Surf_E3
63	Bedrock Type of Component 3	The type of bedrock in the terrain component. (This is only applicable where surficial material is of origin type 'R'). See Table 2-4. <i>These bedrock classes are new to the Terrain Classification System.</i> The intent of using the bedrock code is to provide auxiliary information, as to help qualify texture and/or terrain stability information. It is not intended to provide bedrock stratigraphy.	2	c-x-l-l	Bedrock_3
64	Subsurficial Material Texture of Component 3	The standard terrain texture at the first subsurface stratum. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the first stratum of terrain component 3 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Sttex_3
65	Subsurficial Material of Component 3	A code representing the formative geomorphological process of the first subsurface stratum of surficial material of component 3 of the current terrain polygon. Note: There is only provision for the coding of one subsurface material, for each component in this database. For the mapping of stratigraphy the user will have to modify and/or create a custom database. See Table 2-6.	2	c-x-l-u	Ssurfm_3
66	Subsurficial Material Qualifier of Component 3	A code used to specify whether the formative geomorphological process of the subsurficial stratum of surficial deposit of component 3 is currently 'active' ('A') or 'inactive' ('I'). The assumed status is not recorded. Note: 'G' is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Ssurfm_Q3
67	Subsurficial Material Subtype of Component 3	A project-specific code that indicates a subclass of the genetic material in the second stratum of component 3 of the current terrain polygon. A surficial material subclass is distinguished by characteristics that cannot be adequately represented by the standard surface material origin classes. See Table 2-29.	1	n-x-r	Ssurfm_St3
68	Subsurface Expression of Component 3	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the second stratum in component 3 of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Ssurf_E3

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
69	Sub-Subsuficial Material Texture of Component 3	The standard terrain texture at the Sub-subsurface. The size, shape and sorting of particles in clastic sediments (or the proportion and degree of decomposition of plant fibre in organic sediments) in the third stratum of the terrain component 1 in the current terrain polygon. Indicated by 1–3 lowercase letters. The dominant (1), secondary (2), and tertiary (3) standard textures found in a stratigraphic unit are entered as 3, 2, 1 (see <i>the Terrain Classification Manual, Howes and Kenk, Version 2.0</i>). If only one or two textures are given, the remaining spaces are left blank. See Table 2-5.	3	c-x-r-l	Tttex_3
70	Sub-Subsuficial Material of Component 3	The formative geomorphological process of the Sub-substratum of surficial material of component 3 of the current terrain polygon. See Table 2-6.	2	c-x-l-u	Tsurfm_3
71	Sub-Subsuficial Material Qualifier of Component 3	A code used to specify whether the formative geomorphological process of the first stratum of surficial deposit of component 3 is currently ‘active’ (‘A’) or ‘inactive’ (‘I’). The assumed status is not recorded. Note: ‘G’ is now coded directly with the genetic material (see previous item). See Table 2-7.	1	c-x-l-u	Tsurfm_Q3
72	Sub-Subsuficial Material Subtype of Component 3	A project-specific code for the subtype of the surficial material in the Sub-substratum of the component of the current terrain polygon. A surficial material subtype is distinguished by characteristics that cannot be adequately represented by standard terrain classes. See Table 2-29.	1	n-x-r	Tsurfm_St3
73	Sub-Subsurface Expression of Component 3	A series of 1–3 lowercase letter codes used in combination to describe the three-dimensional shape of the upper surface and the thickness of the Sub-substratum in the component of the current terrain polygon. The first code is the most dominant surface expression. See Table 2-8.	3	c-x-l-l	Tsurf_E3
74	Polygon Number	A repeat of the polygon number on the first page of the form. Repeated on the second page to facilitate correct data entry, only if this type of spreadsheet/database is used.	5	n-e-r	Poly_Nbr
75	1st Geomorphological Process Class	An uppercase letter representing the sole or most significant geomorphological process to affect terrain within the current polygon. <i>A new process has been added to the Terrain Classification Manual, Howes and Kenk, Version 2.0; ‘L’ indicating active seepage.</i> See Table 2-9.	1	c-x-l-u	Geop_1
76	1st Process Qualifier	A code used to specify whether the first geomorphologic process of the polygon is currently ‘active’ (‘A’), or ‘inactive’ (‘I’). See Table 2-7.	1	c-x-l-u	Geop_Q1
77	1st Process Subtype	A project-specific numeric code used to further specify the first geomorphological process within the current terrain polygon. Project specific subtypes of the standard geomorphological processes may be established to distinguish characteristics that cannot be adequately represented by the standard process classes alone. These subtypes should be described in the terrain legend. See Table 2-30.	1	n-x-r	Geop_St1

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
78	1st Process Subclass	1–3 standard lower case letters attached to the first geomorphological process within the current terrain polygon. Subclass modifiers are used to further describe the process. They are usually mapped at a more detailed level. <i>New subclass modifiers have been added to the classification. See Tables 2-10 - 2-13.</i>	3	c-x-l-l	Geop_Scm1
79	2nd Geomorphological Process Class	An uppercase letter representing the second most significant geomorphological process to affect terrain within the current polygon. See Table 2-9.	1	c-x-l-u	Geop_2
80	2nd Process Qualifier	A code used to specify whether the second geomorphologic process of the polygon is currently ‘active’ (‘A’), or ‘inactive’ (‘I’). See Table 2-7.	1	c-x-l-u	Geop_Q2
81	2nd Process Subtype	A project-specific numeric code used to further specify the second geomorphological process within the current terrain polygon. Project specific subtypes of the standard geomorphological processes may be established to distinguish characteristics that cannot be adequately represented by the standard process classes alone. These subtypes should be described in the terrain legend. See Table 2-30.	1	n-x-r	Geop_St2
82	2nd Process Subclass	1–3 standard lower case letters attached to the second geomorphological process within the current terrain polygon. Subclass modifiers are used to further describe the process. They are usually mapped at a more detailed level. <i>New subclass modifiers have been added to the Terrain Classification Manual, Howes and Kenk, Version 2.0. See Tables 2-10 - 2-13</i>	3	c-x-l-l	Geop_Scm2
83	3rd Geomorphological Process Class	An uppercase letter representing the third most significant geomorphological process to affect terrain within the current polygon. See Table 2-9.	1	c-x-l-u	Geop_3
84	3rd Process Qualifier	A code used to specify whether the third geomorphologic process of the polygon is currently ‘active’ (‘A’), or ‘inactive’ (‘I’). See Table 2-7.	1	c-x-l-u	Geop_Q3
85	3rd Process Subtype	A project-specific numeric code used to further specify the third geomorphological process within the current terrain polygon. Project specific subtypes of the standard geomorphological processes may be established to distinguish characteristics that cannot be adequately represented by the standard process classes alone. These subtypes should be described in the terrain legend. See Table 2-30.	1	n-x-r	Geop_St3
86	3rd Process Subclass	1–3 standard lower case letters attached to the third geomorphological process within the current terrain polygon. Subclass modifiers are used to further describe the process. They are usually mapped at a more detailed level. <i>New subclass modifiers have been added to the Terrain Classification Manual, Howes and Kenk, Version 2.0. See Tables 2-10 - 2-13.</i>	3	c-x-l-l	Geop_Scm3

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
87	1st Soil Drainage Class of Polygon	A lowercase letter that represents the soil drainage class for all or most of the current terrain polygon. Soil drainage refers to the rapidity and extent of water removal from the soil in relation to additions; this refers to the annual moisture status of the soil, not just the permeability. Codes include r, w, m, i, p, v. (see Luttmerding et al., 1990, p.43). See Table 2-15.	1	c-x-l-l	Drain_1
88	Soil Drainage Separator of Polygon	Symbols used where a terrain polygon includes two areas of relatively uniform drainage, indicating the proportion of the polygon occupied by each class. The codes include a comma ','; a dash, '-'; (single slash '/'; double slash '//'; <i>These are not commonly used</i>) . See Table 2-16.	2	c-x-l	Drain_Sep
89	2nd Soil Drainage Class of Polygon	A lowercase letter that represents the drainage class for less than half of the current terrain polygon. Soil drainage refers to the rapidity and extent of water removal from the soil in relation to additions (see Luttmerding et al., 1990, p.43). See Table 2-15.	1	c-x-l-l	Drain_2
90	Slope: Lower Limit of Dominant Slope Range	The lower limit of the range of slopes within a terrain polygon, or, where a polygon includes distinctly gentler and steeper slopes (e.g., stepped topography), the lower limit of the slope range associated with most of the polygon. The lower limit could be 12%; data must be entered either in degrees or as a percentage, not both. See Table 2-17.	3	n-x-r	Slpll_1
91	Slope: Upper Limit of Dominant Slope Range	The upper limit of the range of slopes within a terrain polygon, or where a polygon includes distinctly gentler and steeper slopes (i.e. stepped topography), the upper limit of the slope range associated with most of the polygon. The upper limit could be 27%; data must be entered either in degrees or as a percentage, not both. See Table 2-17.	3	n-x-r	Slpul_1
92	Slope Relation	The relative proportion of the two terrain slopes which make up the terrain polygon. The codes are comma ',' indicating two distinct slope portions, and a dash '-' indicating one sloped portion grading to another.	1	c-x-l	Slp_Rel
93	Slope: Lower Limit of Subdominant Slope Range	The lower limit of the range of slopes within a terrain polygon, or, where a polygon includes distinctly gentler and steeper slopes (e.g., stepped topography), the lower limit of the subdominant slope range associated with the polygon. The lower limit could be 2%; data must be entered either in degrees or as a percentage, not both. See Table 2-17.	3	n-x-r	Slpll_2
94	Slope: Upper Limit of Subdominant Slope Range	The upper limit of the range of slopes within a terrain polygon, or where a polygon includes distinctly gentler and steeper slopes (i.e. stepped topography), the upper limit of the subdominant slope range associated with the polygon. The upper limit could be 10%; data must be entered either in degrees or as a percentage, both. See Table 2-17.	3	n-x-r	Slpul_2

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
95	Slope Stability Class	A code representing a class of slope stability. The code must be only one of the standard codes defined, either E1 or E2, Recon, or Detailed slope stability classification systems. All polygons mapped within a project must be consistently classified using the same slope stability classification system. See Tables 2-18 - 2-20.	2	an-x-l-u	Slpstb_Cls
96	Slope Stability Qualifier For Roads	A flag indicating class IV terrain where road construction is likely to cause landslides, but harvesting (without roads) is not likely to cause landslides (see Forest Practices Code, 1995, p.9). See Table 2-21.	1	a-x-l-u	Rdstb_Flg
97	Surface Erosion Potential Class	A class which indicates the likelihood of soil erosion on bare or disturbed soil after logging or road construction (e.g. from ditches or cutbanks). Surface erosion refers to the removal of soil, particle by particle, by surface runoff. It results in sheet erosion and the development of rills and gullies. See Table 2-22.	2	a-x-l-u	Sfcero_Pot
98	Landslide Induced Stream Sedimentation Class	A rating class indicating the likelihood of landslide-induced stream sedimentation. See Table 2-23.	1	n-x-r	Lssed_Cls
99	Surface Erosion Sedimentation Class	A rating class indicating the likelihood of stream sedimentation due to surface erosion. This rating is assigned by the terrain mapper on the basis of air photo interpretation with occasional field confirmation. See Table 2-24.	2	a-x-l-l	Sesed_Cls
100	Bouldery or Blocky Substrate of Polygon	A flag 'b' indicating that the ground within the current polygon is covered by sufficiently large clasts to adversely affect soil development and forest growth. This area will present severe problems for restocking after logging due to absence of topsoil. This flag was the result of discussion with forest companies. (1995, with J.M. Ryder and Geologists). See Table 2-25.	1	a-x-l-l	Bbsub_Flg
101	Mean Aspect of Polygon	The general direction in which the current polygon is facing, measured to the nearest degree of azimuth. See Table 2-25.	3	n-x-r	Mean_Asp
102	Ea Avalanche Hazard Flag	A flag indicating that timber removal from the current polygon may result in increased avalanche hazard to sites downslope. This designation is from the BC Forest Service Environmentally Sensitive Mapping Codes in the Historical Forest Cover Mapping System. See Table 2-26.	1	a-x-l-l	Avlhaz_Flg
103	Polygons of Relatively Low Reliability	A flag indicating that for reasons such as cloud cover on an air photo the current polygon has been mapped with significantly less reliability than adjacent polygons. See Table 2-27.	1	a-x-l-u	Lowrel_Flg
104	Field Check of Polygon	A class which describes the level of field checking done on the current polygon (detailed/reconn/visual). See Table 2-28.	1	a-x-l-l	Fldchktp

Item #	Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
105	Comments	This field may be used to record any pertinent information regarding the polygon. At all times attempt to use referenced classifications which are well defined and understood in the science, or provide thorough definitions for the user. This project specific data will be stored in flat file format, unless keyword or standard designations are required, then contact the data custodian. The data custodian will keep records of new or additional classifications, which are commonly used for project specific applications.	300	c-e-l	Comments

2.3 Codes, names and definitions

Table 2-2 - Metadata for Header on Data Form

Field	Data Examples	Explanatory Notes
Project Name	South Chilcotin (1996)	Includes the portions of the 1996 project.
Project Number	96124	A project record number for FRBC projects (if established)
Geographic Location	On Chilko River, near Hanceville	
Consultant/ Department	J.C. Smith; Terrain Analysis Ltd.	
Mapper Name	R.B. Jones P.Geo (Party Chief)	
Legend Type		<p><i>General:</i> Standard legend, consisting of definitions or short descriptions for all classes of texture, surficial material, surface expression, and geomorphological processes, as in Howes and Kenk, Version 2.0).</p> <p><i>Short:</i> Legend consists of definitions for only those attributes that appear on the map(s). It should also include the reference and credit sections as outlined in <i>Guidelines and Standards for Terrain Mapping in BC</i>, (draft, 1996), with regard to marginal information for terrain maps.</p> <p><i>Terrain Stability:</i> A legend describing slope stability classes. See <i>Mapping and Assessing Terrain Stability Guidebook</i> (Forest Practices Code, 1995).</p> <p><i>Custom/Other:</i> Terrain legends that include <i>project-specific</i> definitions/descriptions, including definitions for all sub-types mapped, and terrain legends developed for interpretative maps – for example, drift exploration potential, potential erosion, and terrain hazards. The credits and references should follow <i>Guidelines and Standards for Terrain Mapping in BC</i>, (draft, 1996).</p> <p>NOTE: for future legend descriptions and formats, see web site information at the Ministry of Employment and Investment, Geological Survey Branch or Ministry of Environment, Resources Inventory Branch.</p>
Legend Source		Used if the mapper has designed a 'generic' or custom legend for one project, and wants to use it for a subsequent project. E.g., J.M. Ryder, East Kootenay, Biophysical Project. 1975.
Map Scale	1:20000 recorded as 20000	This is the map scale at which the original data was captured, not the scale of the air photo. This should be the same scale as that submitted to the repository.
Mapsheet Number	92F091	Refer to Table 1
Date Surveyed	dd-mmm-yy	(10-Apr-97)

The terrain terms in the following tables are mainly from the *Terrain Classification System for British Columbia*, Howes and Kenk, (Version 2, 1997) unless referenced otherwise.

Table 2-3 - Terrain Survey Intensity Levels

Terrain Survey Intensity Levels	Scale	% of Polygons Field Checked	Field Checks per 100 ha	Method of Field Checking	Typical Objectives
A	> 1:20 000	75 - 100	> 1.5	foot traverses	slope stability in sensitive areas; residential land planning; hazard zonation
B	1:10 000 to 1:50 000	50 - 75	1.0 to 3	foot and vehicle traverses	slope stability assessment
C	1:20 000 to 1:100 000	25 - 50	0.5 to >1.0	foot, vehicle, some flying	inventory mapping; biophysical mapping
D	1:20 000 to 1:250 000	0 - 25	0 to 0.1	vehicle and flying	regional planning; preliminary mapping
E	any scale	0	none	no field work (airphoto interp. only)	general reconnaissance

RIC, *Guidelines and Standards for Terrain Mapping in British Columbia* (draft, 1996).

Table 2-4 - Bedrock Classification Codes ¹

Sedimentary Rocks

	General	Code	Specific	Code
Clastic, Calcareous	Fine Grained:	kf	Calcareous Siltstone Calcareous Mudstone Calcareous Shale	kz kd kh
	Medium Grained:	km	Calcareous Greywacke Calcareous Arkose Calcareous Sandstone	kg ka ks
	Coarse Grained:	kc	Calcareous Conglomerate Calcareous Breccia	kn kb
Clastic, Non-Calcareous	Fine Grained:	uf	Siltstone Mudstone Shale	zl md sh
	Medium Grained:	um	Sandstone Greywacke Arkose	ss gk ak
	Coarse Grained :	uc	Conglomerate Breccia	cg bx
Precipitates, Crystalline	Calcareous :	pk	Travertine Limestone Dolomite	tv ls do
	Non-Calcareous:	pu	Gypsum Limonite Barite	gy li ba
Organic	Calcareous :	ok	Marl	ma
	Carbonaceous:	oc	Lignite Coal	lg co

¹ These codes are new to the terrain classification system; they are based on *Describing Ecosystems in the Field* (1990), Table 2.14.

Note: these terms are recorded on the terrain maps as 'umR' or 'coR'.

The bedrock code applies only once per component, either to an 'R' occurring in the surface material or to an 'R' in the subsurface and sub-subsurface material.

Table 2-4 - cont.¹
Igneous Rocks

Intrusive	Acid (Felsic):	ia	Syenite Granite Quartz Monzonite Granodiorite	sy gr qm gd
	Intermediate:	ii	Quartz Diorite Diorite	qd di
	BASIC (Mafic):	ib	Quartz Gabbro Gabbro Pyroxenite Dunite	qg gb py du
Extrusive	Acid (Felsic):	ea	Trachyte Rhyolite Dacite	tr rh da
	Intermediate:	ei	Andesite	an
	BASIC (Mafic):	eb	Quartz Basalt Basalt	qb bs
	Recent Lava Flow	la		
	Pyroclastic:	ep	Tuff Volcanic Breccia Agglomerate	tu vb ag

¹ These codes are new to the terrain classification system; they are based on *Describing Ecosystems in the Field* (1990), Table 2.14.

Note: these terms are recorded on the terrain maps as 'umR' or 'coR'.

The bedrock code applies only once per component, either to an 'R' occurring in the surface material or to an 'R' in the subsurface and sub-subsurface material.

Table 2-4 - cont.¹
Metamorphic Rocks

Foliated	Fine Grained:	ff	Slate Phyllite	sl ph
	Medium to Coarse Grained:	fm	Schist Gneiss Granite Gneiss Diorite Gneiss	sc gn gg dg
	Coarse Grained:	fc	Migmatite	mi
Non-Foliated	Fine Grained:	nf	Argillite Serpentinite	ar sp
	Medium to Coarse Grained:	nm	Quartzite Hornfels Granulite	qt hf gl
	Coarse Grained:	nc	Amphibolite Hornblendite	am hb
	Calcareous:	nk	Marble Dolomite Marble Serpentine Marble	mb dm sm

¹ These codes are new to the terrain classification system; they are based on *Describing Ecosystems in the Field* (1990), Table 2.14.

Note: these terms are recorded on the terrain maps as 'umR' or 'coR'.

The bedrock code applies only once per component, either to an 'R' occurring in the surface material or to an 'R' in the subsurface and sub-subsurface material.

Table 2-5 - Terrain Texture Codes

Code	Name	Size(mm)	Other Characteristics
a	blocks	>256	angular particles
b	boulders	>256	rounded and subrounded particles
k	cobble	64-256	rounded and subrounded particles
p	pebbles	2-64	rounded and subrounded particles
s	sand	0.062-2.000	-
¹ z	silt	0.002-0.062	-
c	clay	<0.002	-
d	mixed fragments	>2	mix of rounded and angular particles
g	gravel	>2	mix of boulders, cobbles and pebbles
x	angular fragments	>2	mix of rubble and fragments blocks
r	rubble	2-256	angular particles
m	mud	<0.062	mix of clay and silt and minor fraction of sand
y	shells	-	shells or shell fragments
e	fibric	-	well-preserved fibre; (40%) identified after rubbing
u	mesic	-	intermediate composition between fibric and humic
h	humic	-	decomposed organic material; < (10%) fibres identified after rubbing
¹ New codes, 1997			

Table 2-6 - Surficial Material Codes

Code	Name	(Assumed Status of Formative Process)	Description
A	anthropogenic	(A)	Man-made or man-modified material
C	colluvium	(A)	Products of mass wastage
D	weathered bedrock	(A)	In situ, decomposed bedrock
E	eolian	(I)	Materials deposited by wind action
F	fluvial	(I)	River deposits
FG	glaciofluvial	(I)	Ice contact fluvial materials
I	ice	(A)	Permanent snow, glaciers and icefields
L	lacustrine	(I)	Lake sediments; includes wave deposits
LG	glaciolacustrine	(I)	Ice contact lacustrine material
M	morainal	(I)	Material deposited directly by glaciers
O	organic	(A)	Accumulation/decay of vegetative matter
R	bedrock	(-)	Outcrops/rocks covered by less than 10 cm of unconsolidated or organic materials.
U	undifferentiated	(-)	Layered sequence; three materials or more
V	volcanic	(I)	Unconsolidated pyroclastic sediments
W	marine	(I)	Marine sediments; includes wave deposits
WG	glaciomarine	(I)	Ice contact marine sediments

Miscellaneous Code

N	not mapped	(-)	Lakes, towns, entities within the map area which are commonly not mapped
----------	------------	-----	--

Table 2-7 - Surficial Material and Geomorphological Process Qualifier Codes

Code	Name	Description
A	active	Used to qualify surficial material and geomorphological processes with regard to their assumed status of activity
I	inactive	
See Howes and Kenk, Version 2.0		

Table 2-8 - Surface Expression Codes

Code	Name	Description
a	moderate slope	¹ Unidirectional surface; $>16^{\circ}$ to $\leq 26^{\circ}$
b	blanket	A mantle of unconsolidated materials; $>1\text{m}$ thick
c	cone(s)	A cone or sector of a cone; $>15^{\circ}$
d	depression(s)	A lower area surrounded by a higher surrounded terrain
f	fan(s)	A sector of a cone ; up to 15°
h	hummock(s)	Hillocks and hollows, irregular in plan; $>15^{\circ}$
j	gentle slope	¹ unidirectional surface; 4° and 15°
k	moderately steep slope	¹ Unidirectional surface; 27 and 35°
m	rolling	Elongate hillocks; 3° to 15° ; parallel forms in plan
p	plain	Level of very gently sloping; 0 to 3°
r	ridge(s)	Elongate hillocks; generally $>15^{\circ}$; parallel forms in plan
s	steep slope	Steep slopes; $>35^{\circ}$
t	terrace(s)	Step-like topography
u	undulating	Hillocks and hollows; $<15^{\circ}$; irregular in plan
v	veneer	Mantle of unconsolidated materials; 10 cm to 1m thick
² w	mantle of variable thickness	A layer or discontinuous layer of surficial materials of variable thickness that fills or partially fills depressions in an irregular substrate. The thickness ranges from zero to about three meters.
² x	thin veneer	A very thin veneer, where there is a dominance of surficial materials about 2 to 20 centimeters thick
<p>¹ The slope ranges apply to the slopes or forms, of the surface expression, created during the time of deposition or by any subsequent modification. The terms, a,k,j for example can not be used on terrain maps as a surrogate for slope classes, related to the lay-of-the-land. See Howes & Kenk, Version 2, 1997.</p> <p>²New codes, 1997</p>		

Table 2-9 - Geomorphological Process Codes

Code	Name	(Assumed Process Status)	Description
A	snow avalanches	(A)	Terrain modified by snow avalanches
B	braiding channel	(A)	Diverging/converging channels; unvegetated bars
C	cryoturbation	(A)	Materials modified by frost heaving and churning
D	deflation	(A)	Removal of sand and silt by wind action
E	meltwater channels	(I)	Channel formation by meltwater
F	slow mass movement	(A)	Slow downslope movement of masses of cohesive or non-cohesive material
H	kettle	(I)	Depressions in surficial material due to the melting of buried or partially buried glacier ice
I	irregularly sinuous channel	(A)	A single, clearly defined main channel displaying irregular turns and bends
J	anastamosing channel	(A)	A channel zone where channels diverge and converge around many vegetated islands
K	karst	(A)	Processes associated with the solution of carbonates
¹ L	abundant surface seepage	(A)	Zones of abundant seepage often found along the base of slope positions
M	meandering channel	(A)	Channels characterized by a regular pattern of bends with uniform amplitude and wave length
N	nivation	(A)	Erosion beneath and along the margin of snow patches
P	pipng	(A)	Subterranean erosion by flowing water
R	rapid mass movement	(A)	Rapid downslope movement of dry, moist or saturated debris
S	solifluction	(A)	Slow downslope movement of saturated overburden across a frozen or otherwise impermeable substrate
U	inundation	(A)	Seasonally under water due to high watertable
V	gully erosion	(A)	Parallel/subparallel ravines due to running water
W	washing	(A)	Modification by wave action
X	permafrost	(A)	Processes controlled by the presence of permafrost
Z	periglacial processes	(A)	Solifluction, cryoturbation and nivation processes occurring within a single unit
¹ New codes, 1997			

Table 2-10 - Geomorphological Process Subclass Codes

Mass Movement Process Subclass Codes

Code	Name	Description
c	soil creep	slow movement of soil
g	rock creep	slow movement of angular debris under periglacial conditions (e.g. rock glaciers)
k	tension cracks	open fissures, commonly near crest of slope
p j	lateral spread –in bedrock –in surficial material	lateral extension of a fractured mass of bedrock or surficial material; movement is predominantly horizontal
e	earthflow	slow viscous flow of material containing a high proportion of silt and clay
m u	slump –in bedrock –in surficial material	sliding of internally cohesive masses of bedrock or surficial material along a slip plane that is concave upward or planar
x	slump–earthflow	combined slump (upper part) and earthflow (lower part)
f	debris fall	descent of a mass of surficial material by falling, bouncing and rolling
b	rockfall	descent of masses of bedrock by falling, bouncing and rolling
s	debris slide	sliding of disintegrating mass of surficial material
r	rockslide	descent of large masses of disintegrating bedrock by sliding
d	debris flow	rapid flow of saturated debris
t¹	debris torrent	rapid flow of a mixture of water, earth and vegetation debris down a steep, well-defined stream channel
1[“]	initiation zone	includes sites or zones of instability, <i>head scarps</i> of debris slides and other kinds of mass movement, and <i>sources</i> of rockfall and debris flows
¹ New codes, 1997		

Table 2-11 - Avalanche Process Subclass Codes¹

Code	Subclass Name	Definitions
f	avalanche tracks -major	in zones of coniferous forest: broad avalanche track(s) occupied by predominantly shrubby, deciduous vegetation, conifers largely absent
m	-minor	similar to above, but generally narrower than the height of adjacent trees
w	-mixed	polygon includes both major and minor avalanche tracks
o	-old	tracks are clearly visible on air photos, but are less well defined than active tracks because they are partly or completely occupied by young conifers
¹ New codes, 1997		

Table 2-12 - Fluvial Process Subclass Codes¹

Code	Subclass Name	Definitions
u	progressive bank erosion	persistent bank erosion, indicated by the presence of undercut banks, overhanging and fallen trees and much timber in the channel; old air photos and historical information can be used as evidence
a	abrupt channel diversion; aversion	present channel has recently shifted abruptly to a previously vegetated area; former channel can be identified on air photos or on ground
b	backchannels (undivided)	small channels on a floodplain which may or may not be connected to the main channel
p	permanent river-fed (backchannels)	joined to the main channel at the upstream end, allowing flowing or standing water all year
e	ephemeral river-fed (backchannels)	joined to the main channel at the upstream end, but dry during late summer
s	spring-fed (backchannels)	water is maintained during the late summer by the emergence of floodplain groundwater
t	permanent, tributary-fed (backchannels)	either flowing or standing water from tributaries is present in the backchannel all year
r	ephemeral, tributary-fed (backchannels)	normally fed by tributaries, but dry during late summer
¹ New codes, 1997		

Table 2-13 - Permafrost Process Subclass Codes¹

Code	Subclass Name	Definitions
p	palsas peat plateaus	flat-topped or rounded mounds and ridges of peat or peaty earth formed by differential frost-heaving; contain perennial ice lenses and a core of permafrost
t	thermokarst: subsidence	ground surface depressions which are created by the thawing of ice-rich permafrost and associated soil subsidence
e	thermokarst: thermal erosion by water	gullies and depressions created by melting of ice-rich permafrost due to heat loss transfer from flowing water or lakes
f	thaw flow slides	slope failures caused by the thawing of permafrost on slopes
w	ice-wedge polygons	intersecting narrow cracks that contain ice-wedges comprise polygonal patterns on ground underlain by permafrost
r	patterned ground	collective term for the regular surface features, like stone polygons, frost boils, and stone stripes, that are characteristic of ground that is subject to intensive frost (freeze thaw) action; subclass can also be applied to other periglacial processes
¹ New codes, 1997		

Table 2-14 - Component Relation Delimiters Codes

Code	Definition
·	components on either side of the symbol are approximately equal, in proportion (Note: The = sign can appear on the plotted map as a ‘.’)
/	the component in front of the symbol is more extensive than the one that follows
//	the component in front of the symbol is considerably more extensive than the component that follows
0 to 9	The amount of each component is rated with a number(decile), i.e. 6Mbv 4Cbv

Table 2-15 - Soil Drainage Codes

Code	Definition
x	very rapidly drained
r	rapidly drained
w	well drained
m	moderately well drained
i	imperfectly drained
p	poorly drained
v	very poorly drained
Describing Ecosystems in the Field, (1990)	

Table 2-16 - Drainage Separator Codes

Code	Definition
'	'w, i' indicates that no intermediate classes between well and imperfectly drained are present
-	'w-i' indicates that all intermediate classes between well and imperfectly drained are present.
/	'r/p' rapid drainage is dominant, poor drainage is sub-dominant
//	'r//p' rapid drainage is significantly dominant, poor drainage is minor

Table 2-17 - Slope Steepness

Code	Term	Definition
(a number)	Slope: lower limit of the dominant slope.	The lower limit of the slope within a terrain polygon, or, where a polygon includes distinctly gentler and steeper slopes; record the lower limit of the slope associated with most of the polygon ; all of this data must be entered either in degrees or percent, not both.
(a number)	Slope: upper limit of the dominant slope.	The upper limit of the slope within a terrain polygon, or where a polygon includes distinctly gentler and steeper slopes; record the upper limit of the slope associated with most of the polygon ; all of this data must be entered either in degrees or as a percentage, not both.
(a number)	Slope: lower limit of the subdominant slope.	If a polygon includes distinctly gentler and steeper slopes; record the lower limit of the slope associated with the subdominant portion of the polygon ; all of this data must be entered either in degrees or as a percentage, not both.
(a number)	Slope: upper limit of the subdominant slope.	If a polygon includes distinctly gentler and steeper slopes record the upper limit of the slope range associated with the subdominant portion of the polygon ; all of this data must be entered either in degrees or as a percentage, not both.

Table 2-18 - Terrain Stability Classes¹ Slope Stability Classes for Detailed Mapping²

Code	Class Name	Definition
1	I	A slope in which no significant stability problems exist.
2	II	A slope in which there is a very low likelihood of landslides following timber harvesting or road construction. However minor slumping is expected along road cuts especially for on or two years following construction.
3	III	A slope on which stability problems can develop. Timber harvesting should not significantly reduce terrain stability; there is a low likelihood of landslide initiation following timber harvesting. Minor slumping is expected along road cuts, especially for one or two years following construction; there is a low likelihood of landslide initiation following road-building.
4	IV	A terrain polygon expected to contain areas with a moderate likelihood of landslide initiation following timber harvesting or road construction. Wet season construction will significantly increase the potential for road related landslides. A field inspection of these areas is to be made by a qualified terrain specialist prior to any development, to assess the stability of the affected area.
5	V	A terrain polygon expected to contain areas with a high likelihood of landslide initiation following timber harvesting or road construction. Wet season construction will significantly increase the potential for road related landslides. A field inspection of these areas is to be made by a qualified terrain specialist prior to any development, to assess the stability of the affected area.

¹Forest Practices Code of British Columbia 1995. *Mapping and Assessing Terrain Stability Guidebook* B.C. Ministry of Forests and BC Environment pg. 10. With reference to the printed terrain maps, the symbol which conventionally appears on the map is a Roman Numeral, for example, 'IV'.

²Refer to latest Forest Service stability 'guidebook', in progress (1998) for updated definitions.

Table 2-19* - Classes for Reconnaissance Terrain Stability Mapping^{1 2}

Code	Class Name	Definition
S	Stable	There is negligible to low likelihood of landslide initiation following timber harvesting or roadbuilding.
P	Potentially Unstable	Expected to contain areas with a moderate likelihood of landslide initiation following timber harvesting or road building.
U	Unstable	Natural landslide scars are present. Expected to contain areas with a high likelihood of landslide initiation following timber harvesting or road building.

¹Forest Practices Code of British Columbia 1995. *Mapping and Assessing Terrain Stability Guidebook* B.C. Ministry of Forests and BC Environment pg. 4
²Refer to latest Forest Service stability 'guidebook', in progress (1998) for updated definitions.

Table 2-20* - Slope Stability Qualifier for Roads¹

Code	Class Name	Definition
R	Qualifier for roads	This symbol is used to modify terrain stability class IV in terrain that responds differently to logging and road building. It indicates a low likelihood of landslides after timber harvesting, but a moderate likelihood of slides as a result of road construction. (The mapper must provide a suitable description in the map legend). E.g. IV_R

¹Forest Practices Code of British Columbia 1995. *Mapping and Assessing Terrain Stability Guidebook*. B.C. Ministry of Forests and BC Environment pg. 9

Table 2-21* - Surface Erosion Potential Class Codes^{1 2}

Code	Class Name	Definition
VL	Very low	
L	Low	
M	Moderate	
H	High	
VH	Very high	

¹Forest Practices Code of British Columbia 1995. *Mapping and Assessing Terrain Stability Guidebook*. B.C. Ministry of Forests and BC Environment pg. 14
²Refer to latest Forest Service stability 'guidebook', in progress (1998) for updated definitions.

* 'Due to regional variations in climate, geology, soil and other factors, few specific criteria apply universally across all regions of the province. The mapper must develop criteria for stability classes specific to the map area', (Forest Practices Code 1995). This includes definitions of slope classes.

Table 2-23* - Class Codes for Potential Sediment Delivery From Surface Erosion Sources^{1 2}

Code	Class Name	Definition
vl	Very Low Potential	
l	Low Potential	
m	Moderate Potential	
h	High Potential	
vh	Very High Potential	

¹Forest Practices Code of British Columbia 1995. *Mapping and Assessing Terrain Stability Guidebook*. B.C. Ministry of Forests and BC Environment pg. 15.
²Refer to latest Forest Service stability 'guidebook', in progress (1998) for updated definitions.

Table 2-24 - Bouldery or Blocky Substrate

Code	Class Name	Definition
b	Bouldery Substrate	Within a terrain polygon the ground is covered with boulders or blocks that are sufficiently numerous to seriously restrict forest regeneration or replanting.

J.M. Ryder. 1995. Personal Communication. Based on meetings with geologists mapping forest land.

* 'Due to regional variations in climate, geology, soil and other factors, few specific criteria apply universally across all regions of the province. The mapper must develop criteria for stability classes specific to the map area', (Forest Practices Code 1995). This includes definitions of slope classes.

Table 2-25 - Mean Aspect

Record the aspect, in degrees, which best represents the aspect of terrain polygon.

Code	Class Name	Definition
E.g. 123°	Mean Aspect	The mean aspect in degrees

Table 2-26 - 'Ea' (Forest Service) Snow Avalanche Hazard Flag

Note: This system is used only at the specific request of a forestry inventory official.

Code	Class Name	Definition
a	E.S.A Snow Avalanche	Snow avalanches are likely to adversely affect timber values, or to damage roads or other structures, or pose a hazard to humans.
Ministry of Forests 1992. Forest <i>Classification/Sampling and Environmentally Sensitive Areas</i> . Ea - Snow Avalanche. Forest Inventory. Victoria. B.C.		

Table 2-27 - Polygons of Relatively Low Reliability Flag

Code	Class Name	Definition
L	LowRely	This applies, for example to areas on air photos which have cloud cover, snow cover or are in heavy shadow.
J.M. Ryder. 1995. Personal Communication. Based on meetings with geomorphologists mapping forest land.		

Table 2-28 - Field Check Class

Code	Class Name	Definition
d	detailed	A complete description of the terrain features, including material, topography, hydrology, and processes if evident, is done on a site(s) in the polygon. Usually involves use of a data form.
r	recon	A reconnaissance level description of the terrain features, necessary to confirm mapping, done during traverse of a polygon. Usually involves short free-format notes in a notebook.
v	visual	Site viewed from a distance during foot or air traverses; applies only to terrain types that can be reliably mapped by visual inspection; optional: briefly note on air photo or map.
Guidelines and Standards for Terrain Mapping In British Columbia. (RIC) 1996.		

Table 2-29 - Surficial Material Subtype

Code	Description
(a number)	A number following the genetic material (M1). This notation can be used to indicate a particular type of material in a study area. For example, a compact clayey calcareous till.

Table 2-30 - Geomorphological Process Subtype

Code	Description
(a number)	A number following a geologic process. For example, this notation can be used to indicate a particular type of gully. For example, deep gullies subject to failures in fine sandy glaciolacustrine materials: -V1

4. Digital Data Specification For terrain Mapping In GIS

4.1 Logical Data Description

A Geographic Information System stores two types of data in a database; **Spatial** data and descriptive, or **attribute** data. Spatial data, describes the location and shape of features being mapped. The attribute data describes the spatial features being mapped. These two types of data are linked by a common field or fields within the GIS. The linkage between the spatial and attribute data is critical to the integrity of the data stored within the GIS.

Spatial data can be collected, and stored in GIS's in a variety of ways. The most basic methods are to store map features as points, lines, or polygons. All terrain data being collected in British Columbia at this time is stored as points, lines, or polygons.

POINTS	Represent features that are too small to be mapped as lines or polygons. These may be sample sites, wells, or sink holes.
ARCS	Represent linear features that are too small to be mapped as polygons. Such as rivers, creeks, roads, and pipelines.
POLYGONS	Represent features that can be mapped as areas. Examples of area features are lakes, large rivers, and terrain polygons.

Features captured during a terrain mapping project can be divided into four broad categories.

1. Terrain polygons. These are unique areas that have been derived on the basis of their terrain attributes. Such as surface and subsurface texture, expression, and genetic material. The attributes that describe these polygons are stored in a number of tables in a relational database. The spatial and aspatial data is linked through a unique identification code which is assigned to each and every terrain polygon. This code is stored in the field "ter_tag" in the polygon attribute table. The database which contains the spatial data is fully described in section 5 of this manual. Section 2 describes the attribute data in detail and discusses tools that can be used to aid in the collection of this data.
2. On site symbols as described in "The Guidelines and Standards for Terrain Mapping" that can be collected as points or lines in the GIS but are too small to be collected as polygons. Examples of these features are dunes, eskers, and sinkholes.
3. On site symbols as described in "The Guidelines and Standards for Terrain Mapping" that can be collected as polygons in the GIS. Examples of these features may include gravel pits, sink holes or a cutface.

*Standard for Digital
Terrain Data Capture*

4. Sample/Observation Sites. The locations of all field samples taken during data collection are represented in this coverage. Field samples may be collected as points or line features only. Examples include bore holes, pits, air observation, and trenches.

Each feature which may be captured is identified by a unique feature code, if the data is captured in ARC/INFO, or a unique combination of level and colour in an IGDS design file. A Provincial Feature Code database is currently being maintained at the BC Environment Web Site. As new types of geographic objects or “features” are defined in support of an inventory they should be described in the Provincial Feature Code database.

4.2 Physical Data Description

The four ARC/INFO coverages will have the following feature attributes tables defined as described below.

Terrain Polygon Coverage Feature Attribute Tables.

Coverages containing terrain polygons must have a **POLYGON ATTRIBUTE TABLE (PAT)** and an **ARC ATTRIBUTE TABLE (AAT)**. The PAT contains the link between the terrain polygons and their associated attributes, while the AAT contains Arc Attributes. Table 4-1 specifies the required format of the **PAT**, Table 4-2 shows the specifics of the **AAT**.

Table 4-1 - Polygon Attribute Table for Terrain Polygons

COLUMN	ITEM NAME	WIDTH	OUTPUT	TYPE	N.DEC	ALTERNATE NAME	INDEXED
1	AREA	4	1 6	F	0	-	
5	PERIMETER	4	12	F	3	-

Point and Line On Site Symbols Coverage Feature Attribute Tables.

Coverages containing point and line on site symbols must have a **POINT ATTRIBUTE TABLE (PAT)** and an **ARC ATTRIBUTE TABLE (AAT)**. Both the PAT and AAT contain the fields, FCODE and SRC_FCODE for storing feature code values, as well as the field COMMENT. Table 4-3 specifies the required format of the **PAT**, Table 4-4 shows the specifics of the **AAT**.

4.2.1 ARC/INFO Feature Classification

The internal attribute tables for point, line, and area features may contain the fields FCODE, SRC_FCODE, and COMMENT. COMMENT is a 30 character text field which stores unstructured information on features, such as the height of a waterfall, or the water temperature of a mineral spring. The contents of this field should be self-evident, since it has no specified domain. For example, the height of a waterfall should be stored as 'height 20 metres', not as '20'.

The fields FCODE and SRC_CODE are 10 character text fields which store the **FEATURE CODE** used to classify the spatial data being mapped. All points, lines, and polygons in all terrain coverages must be assigned a feature code, in conformance with *National Standards for the Exchange of Digital Topographic Data* (1984). Each feature code consists of two uppercase letters and eight digits. ARC/INFO stores them as a 10-character point or line attribute named 'FCODE'. Tables 4-9 to 4-14 list the features that may be captured in a terrain mapping project, and their associated feature codes. Note the following specialised rules for feature codes:

1. Terrain polygon boundaries are assigned feature codes that indicate the relative accuracy of the polygon boundary. The boundaries may be definite, indefinite or assumed. For information see (*Guidelines and Standards for Terrain Mapping in BC*, (1996), page 20).
2. Wherever a polygon boundary is a feature from another coverage (for example, a lake shore line from a TRIM data set), the feature code of the original feature code must be maintained in a separate field called 'SRC_FCODE'.

4.2.2 IGDS Feature Classification

Features are classified using a unique combination of level, colour, and type in the IGDS design file. Tables 4-9 to 4-14 list the features that may be captured in a terrain mapping project, and their associated IGDS level, colour, and type values.

4.2.3 Terrain Features and Feature Classification Codes.

All of the on site symbols, and sample site features that maybe captured during a terrain mapping project can be described with a finite set of predefined attributes which are presented here in detail. The following six tables; **Terrain Classification Codes** table 4-9, **Linear On Site Symbol Classification Codes** table 4-10, **Point On Site Symbol Classification Codes** table 4-11, **Polygonal On Site Classification Codes** table 4-12, **Linear Sample Site Classification Codes** table 4-13 and, **Point Sample Site Classification Codes** table 4-14, list the features, and their associated feature codes and IGDS specifications which may be captured when terrain mapping. These feature codes or IGDS specifications must be used to identify terrain features being mapped.

Where the 'Source' column reads 'CCSM', the definition of the feature has been taken from the Canadian Council on Surveying and Mapping (see their *Second Draft Report of National Standards for the Exchange of Digital Topographic Data*, volume II (July 1984)). These codes and definitions were used wherever possible to maintain consistency with other mapping sources. Where the 'Source' column reads 'Terrain', the definition for the feature has been taken from the table following page 131 of *Guidelines and Standards for Terrain Mapping in British Columbia* (1996). New codes were generated for these features where there was no close equivalent in the above document. Digital tables of these feature codes, their definitions, and ARC/INFO symbology are available on the MELP World Wide Web site at <http://www.env.gov.bc.ca/>

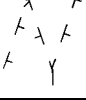

Table 4-9 - Terrain Polygon Classification Codes.

ARC/INFO FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE

WI84555110	Terrain	Terrain polygon boundary	Defined			10	149	4
	Terrain	Terrain polygon label				10	150	7

Table 4-10 - Linear On Site Symbol Classification Codes.

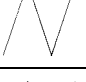

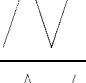

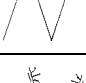

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
AD01000000	CCSM	Archaeological Area				14	1	4	
HB01005000	Terrain	Arete		A narrow, jagged, serrate mountain crest, or a narrow, rocky, sharp-edged ridge or spur, commonly present above the snowline in rugged mountains sculptured by glaciers, and resulting from the continued backward growth of the walls of adjoining cirques.		14	2	4	
HB02105000	Terrain	Block Field		A level or gently sloping area covered with blocks derived from underlying bedrock or drift by weathering and/or frost heave, and having undergone no significant down slope movement; characteristic of periglacial regions.		14	3	4	
HB02485000	Terrain	Boulder Field		A flat or gently sloping area covered with a continuous veneer of large angular and subangular blocks of rock, derived from well-jointed underlying bedrock by intensive frost action and usually occurring in situ on high, flat topped mountains.		14	4	4	
GA03950000	CCSM	Canal				See TRIM IDGS specifications			
HB04600000	CCSM	Cave		A naturally-formed, subterranean open area or chamber, or series of chambers. The implication of size is that it is large enough for a human being to enter. Partial synonym: cavern.	(symbol)	14	6	4	
HB05450000	CCSM	Cinder Cone		A steep-sided conical hill formed by the accumulation of cinders and other pyroclastic deposits around a volcanic vent; normally of basaltic or andestic composition.		14	7	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB05475000	Terrain	Cirque		A rounded recess in a mountain formed by glacial erosion, with steep head and side walls, and a relatively gently-sloping floor that is commonly a basin with a small lake and terminated down valley by a convex break of slope.		14	8	4	
HB05785000	Terrain	Coastal Aggradation		The building up of the coast by deposition, as in the development of a beach.	Geomorphological process	14	9	4	
HB07585000	Terrain	Crag		A streamlined hill consisting of a knob of resistant bedrock.		14	10	4	
FE07885000	Terrain	Cross-Section		A two-dimensional representation through the subsurface.	Sampling layer	14	11	4	
DD08300000	CCSM	Cut	Railway			See TRIM IGDS specifications			
DD08350000	CCSM	Cut	Roadway	An excavation made to allow the level or nearly level passage of a road or track through a hill. See also 'fill'.		See TRIM IGDS specifications			
GA08450000	CCSM	Dam	section. Top	A barrier to prevent the flow of water, or to raise and control the level of water by forming a reservoir.		See TRIM IGDS specifications			
GA08800000	CCSM	Ditch		A trench dug in the earth, as for drainage or irrigation.		See TRIM IGDS specifications			
HB09050000	CCSM	Drumlin		A streamlined hill or ridge of till or other drift, with a long axis that parallels the direction of former ice flow; generally the upstream end is widest and highest, and the drumlin tapers in the downflow direction.		14	16	4	
GB09150000	CCSM	Dugout		Any shallow artificial pond or other water filled excavation.		14	17	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB09250000	CCSM	Dune		A low ridge, hummock, or mound of loose sandy material transported and deposited by wind.		14	18	4	
HB09250001	CCSM	Dune	Inactive	A stabilized, low ridge, hummock, or mound of loose sandy material transported and deposited by wind.		14	19	4	
DD09900000	CCSM	Embankment Fill	Railway			See TRIM IGDS specifications			
DD09950000	CCSM	Embankment Fill	Roadway			See TRIM IGDS specifications			
HB10150000	CCSM	Escarpment		A steep slope that is usually of great lateral extent compared to its height, such as the risers of river terraces and steep faces associated with stratified rocks.		14	22	4	
HB10150310	Terrain	Escarpment	Bedrock definite	A clear and obvious line of bedrock cliffs or bluffs produced by faulting or by erosion.		14	23	4	
HB10150319	Terrain	Escarpment	Bedrock indefinite	An unclear line of bedrock cliffs or bluffs produced by faulting or by erosion.		14	24	4	
HB10150320	Terrain	Escarpment	Overburden definite	A clear and obvious relatively steep and straight, cliff-like face or slope composed of unconsolidated sediment.		14	25	4	
HB10150329	Terrain	Escarpment	Overburden indefinite	An unclear relatively steep and straight, cliff-like face or slope composed of unconsolidated sediment.		14	26	4	
HB10200000	CCSM	Esker		A sinuous ridge of sand and gravel resulting from deposition by meltwater in a tunnel beneath or within a glacier or ice sheet. The ridges generally trend at right angles to a glacier margin.		14	27	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB10200310	CCSM	Esker	flow known	A sinuous ridge of sand and gravel resulting from deposition by meltwater in a tunnel beneath or within a glacier or ice sheet. The ridges generally trend at right angles to a glacier margin. Flow direction during deposition is known.		14	28	4	
HB10200319	CCSM	Esker	flow unknown	A sinuous ridge of sand and gravel resulting from deposition by meltwater in a tunnel beneath or within a glacier or ice sheet. The ridges generally trend at right angles to a glacier margin but the direction of flow during deposition is unknown.		14	29	4	
GA10450000	CCSM	Falls		A waterfall which in most cases starts with a series of rapids, then goes over a vertical or near vertical drop and ends with a cataract over the debris at the bottom of the drop. Many topographic maps give the height of the vertical drop if over a specific height.	(line)	See TRIM IGDS specifications			
HB10495110	Terrain	Fan	Alluvial	A fan-shaped deposit of fluvial sand and gravel, usually located at the mouth of a tributary valley; a type of floodplain.		14	31	4	
HB10495120	Terrain	Fan	Colluvial	A fan-shaped mass of sediments deposited by colluvial processes, most commonly debris flows.		14	32	4	
HB10495130	Terrain	Fan	Talus Cone	A small, cone-shaped or apron-like landform at the base of a cliff, consisting of poorly sorted talus that has accumulated episodically.		14	33	4	
GD11400000	CCSM	Flow Arrow		An arrow placed on a map to show the direction of flow.		See TRIM IGDS specifications			
HB11775000	Terrain	Fossil		An area in which remains, traces, or imprints of a plant or animal has been preserved by natural processes.		14	35	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB11775110	Terrain	Fossil	Marine	An area in which remains, traces, or imprints of a plant or animal has been preserved by natural processes in a marine environment.		14	36	4	
HB11775120	Terrain	Fossil	Terrestrial	An area in which remains, traces, or imprints of a plant or animal has been preserved by natural processes in a terrestrial environment.		14	37	4	
HB12225000	Terrain	Geologic Contact		A plane or irregular surface between two types or ages of rock or sediment.		14	38	4	
HB12225120	Terrain	Geologic Contact	Approximate	An approximate plane or irregular surface between two types or ages of rock or sediment.		14	39	4	
HB12225110	Terrain	Geologic Contact	Defined	A clear or obvious plane or irregular surface between two types or ages of rock or sediment.		14	40	4	
HB12225130	Terrain	Geologic Contact	Inferred	An inferred plane or irregular surface between two types or ages of rock or sediment.		14	41	4	
GD12300000	CCSM	Glacier		A body of ice formed by the compaction and recrystallization of snow, that has definite lateral limits, and with motion in a definite direction.		See TRIM IGDS specifications			
HB14315000	Terrain	Ice Contact Delta		An accumulation of stream-transported sediments deposited in a body of water, on or in contact with glacial ice. The landform is flat or very gently sloping, and triangular or fan-shaped in plan.		14	43	4	
HB15065000	Terrain	Kame		Irregular or conical hillocks composed chiefly of sand and gravel; formed by deposition of meltwater-transported sediments in contact with (against, within, or upon) stagnant glacier ice; a type of glaciofluvial deposit.		14	44	4	
HB15125000	Terrain	Kettle Hole		A closed depression or hollow in glacial drift which has resulted from the melting of a buried or partly buried mass of glacier ice; common in glaciofluvial deposits.		14	45	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
GB15250000	CCSM	Lagoon		A small narrow stretch of sea water separated or partly separated from the ocean by a low, narrow, elongate strip of land.		14	46	4	
GB15300000	CCSM	Lake	Definite	A large, inland body of salt or fresh water, entirely surrounded by land. Larger than a pond.		See TRIM IGDS specifications			
GB15300120	CCSM	Lake	Dry	A lake bed from which all water has drained or evaporated.		See TRIM IGDS specifications			
GB15300140	CCSM	Lake	Intermittent			See TRIM IGDS specifications			
HB15850000	CCSM	Lava Bed		A landform area covered with lava.		14	50	4	
HB16415110	Terrain	Linear Feature	Direction Known	A feature arranged in a line or lines.		14	51	4	
HB16415119	Terrain	Linear Feature	Direction Unknown	A feature arranged in a line or lines.		14	52	4	
GC17100000	CCSM	Marsh		A water-saturated, poorly drained area, intermittently, or permanently water covered, having aquatic and grass like vegetation, essentially without trees and without peat like accumulation. See also Bog, Fen.	area outline	See TRIM IGDS specifications			
HB17275110	Terrain	Meltwater Channel	Definite	A channel or valley formed or followed by a glacial meltwater stream.		14	54	4	
HB17275119	Terrain	Meltwater Channel	Indefinite	A channel or valley formed or followed by a glacial meltwater stream.		14	55	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB17275120	Terrain	Meltwater Channel	Lateral, Definite	A channel or valley formed or followed by a glacial meltwater stream.		14	56	4	
HB17275129	Terrain	Meltwater Channel	Lateral, Indefinite	A channel or valley formed or followed by a glacial meltwater stream.		14	57	4	
HB17275130	Terrain	Meltwater Channel	Left Bank	A channel or valley formed or followed by a glacial meltwater stream.		14	58	4	
HB17275140	Terrain	Meltwater Channel	Right Bank	A channel or valley formed or followed by a glacial meltwater stream.		14	59	4	
HB17275150	Terrain	Meltwater Channel	Subglacial, Definite	A channel or valley formed or followed by a glacial meltwater stream.		14	60	4	
HB17275159	Terrain	Meltwater Channel	Subglacial, Indefinite	A channel or valley formed or followed by a glacial meltwater stream.		14	61	4	
HB17275001	TFIC - W.Kilby	Meltwater Channel Minor	Direction of flow unknown	A channel or valley formed or followed by a glacial meltwater stream.		14	62	4	
HB17275000	TFIC - W.Kilby	Meltwater Channel		A channel or valley formed or followed by a glacial meltwater stream.		14	63	4	
AG17600000	CCSM	Mine	Open Pit	A pit or excavation from which ores, coal, etc. are taken by digging. A open pit mine is generally larger and deeper than a quarry.		14	64	4	
AG17700000	CCSM	Mine	Strip			14	65	4	
AB17500000	CCSM	Mine	Underground			14	66	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
AB17500001	CCSM	Mine	Abandoned Underground			14	67	4	
CG17800000	CCSM	Mine Entrance	Adit	A near horizontal passage from the surface into a mine.		14	68	4	
CG17800001	CCSM	Mine Entrance	Adit Abandoned			14	69	4	
CG17900000	CCSM	Mine Shaft		A vertical or inclined excavation through which a mine is worked.		14	70	4	
CG17900001	CCSM	Mine Shaft	Abandoned			14	71	4	
HB18700000	CCSM	Moraine		A landform that consists of till or, less commonly of other drift; it exhibits a variety of shapes, ranging from plains to mounds and ridges, that are initial constructional forms independent of underlying bedrock or older materials.		14	72	4	
HB18700110	CCSM	Moraine	Lateral	A ridge built along the side of a valley glacier.		14	73	4	
HB18700119	CCSM	Moraine	Lateral Indefinite	An indefinite ridge built along the side of a valley glacier.		14	74	4	
HB18700120	CCSM	Moraine	Medial	A morainal ridge in the middle of a glacier, parallel to the direction of glacier flow, and formed the by the union of lateral moraines of two coalescing glaciers.		14	75	4	
HB18700129	CCSM	Moraine	Medial Indefinite	An indefinite morainal ridge in the middle of a glacier, parallel to the direction of glacier flow, and formed the by the union of lateral moraines of two coalescing glaciers.		14	76	4	

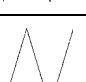

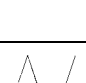

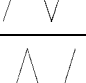

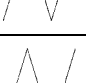

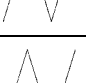

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB18700130	CCSM	Moraine	Terminal	The end moraine that marks the furthest point reached by an advancing glacier.		14	77	4	
HB18700139	CCSM	Moraine	Terminal Indefinite	The indefinite end moraine that marks the furthest point reached by an advancing glacier.		14	78	4	
HB19265110	Terrain	Occurrence / Concentration	Gravel			14	79	4	
HB19265120	Terrain	Occurrence / Concentration	Peat	A concentration of semi-carbonized plant remains.		14	80	4	
HB19265130	Terrain	Occurrence / Concentration	Sand	A concentration of sand particles between 0.062-2 mm.		14	81	4	
GD21065000	Terrain	Permafrost		Ground in which temperature has remained below 0 degrees Celsius continuously for at least 2 years, regardless of type of material or water content; a thermal condition.		14	82	4	
HB21515000	Terrain	Piping		Subsurface erosion of particulate materials by flowing water, resulting in the formation of underground caves and conduits and the development of collapse-depressions at the land surface.		14	83	4	
AG21550000	CCSM	Pit		An excavation where sand or gravel has been removed for use in construction. It is not used in Canada as a synonym for coal mine. A borrow pit is the excavation left when earth or sand have been removed.		14	84	4	
AG21550001	CCSM	Pit	Abandoned			14	85	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
AG21550110	CCSM	Pit	Gravel	An open pit where gravel is mined.		14	86	4	
AG21550120	CCSM	Pit	Sand	An open pit where sand is mined.		14	87	4	
AG21550130	CCSM	Pit	Shale			14	88	4	
AG22450000	CCSM	Quarry	Dry	An open excavation for which building stone, slate etc. is obtained.		14	89	4	
GB22500000	CCSM	Quarry	Water Filled			14	90	4	
HB23050000	CCSM	Raised Beach/Strand Lines		An ancient beach occurring above the present shoreline and separated from the present beach as a result of terrain uplift or the lowering of the sea or lake level.		14	91	4	
HB23050310	Terrain	Raised Beach/Strand Line	Definite	An obvious abandoned shoreline.		14	92	4	
HB23050319	Terrain	Raised Beach/Strand Line	Indefinite	An indefinite abandoned shoreline.		14	93	4	
GA23500000	CCSM	Rapids		A fast flowing section of a watercourse generally with exposed rocks or boulders.	line	See TRIM IGDS specifications			
GA24850000	CCSM	River/Stream	Definite	A natural, freshwater surface body of running water that serves as a natural outlet for a drainage area or a basin of considerable extent. A stream is smaller than a river but larger than a brook or c		See TRIM IGDS specifications			

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
GA24850110	CCSM	River/Stream	Braided			See TRIM IGDS specifications			
GA24850120	CCSM	River/Stream	Disappearing	A surface stream that disappears into an underground channel.		See TRIM IGDS specifications			
GA24850130	CCSM	River/Stream	Dry	The bed of a former river which has ceased to flow due to climatic change or the formation of a new river channel.		See TRIM IGDS specifications			
GA24850310	Terrain	River/Stream	Gully	A small valley or ravine, longer than wide, and typically from a few metres to a few tens of metres across.		14	99	4	
GA24850150	Terrain	River/Stream	Intermittent			See TRIM IGDS specifications			
GA90000110	TRIM	River/Stream	Left Bank			See TRIM IGDS specifications			
GA24850131	Terrain	River/Stream	Left Bank - Dry	The left side of a dry river or stream when facing down channel.		14	102	4	
GA90000120	TRIM	River/Stream	Right Bank			See TRIM IGDS specifications			
GA24850132	Terrain	River/Stream	Right Bank - Dry	The right side of a dry river or stream when facing down channel.		14	104	4	
HB25335000	Terrain	Roche Moutonee		A knob of rock with a whale-back form, the long axis of which is oriented parallel to former ice flow, and having a smooth, glacially-abraded stoss (up-flow) slope and a much steeper and rougher, glacially-plucked lee slope.		14	105	4	
GD25375000	Terrain	Rock Glacier		A tongue shaped or lobate, ridged accumulation of angular rock fragments containing interstitial ice that moves slowly downslope; morphologically similar to a glacier.		14	106	4	
HB25400000	CCSM	Rock Outcrop		A portion on the surface where one or more bedrock geological formations are exposed.		14	107	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB25745000	Terrain	Sackung	Sagging Slope	Uphill-facing scarps on mountain sides that trend parallel to contours and developed as a result of gravitational movement.		14	108	4	
HB27550000	CCSM	Sinkhole		A funnel shaped depression in the land surface that communicates with a subterranean passage developed by solution, common in limestone and karst regions.	symbol	14	115	4	
HB27900000	CCSM	Slide		A landform feature consisting of a descent of a mass of earth or rock.	area outline	14	116	4	
HB27900330	Terrain	Slide	Debris	Downslope movement of a mixture of saturated debris, including soil, weathered rock, mud, boulders, and vegetative debris.		14	117	4	
HB27900333	Terrain	Slide	Debris - Flow	Rapid flow of a mixture of saturated debris, including soil, weathered rock, mud, boulders, and vegetative debris.		14	118	4	
HB27900335	Terrain	Slide	Debris Rotational	A landslide in which movement takes place along a well defined, curved shear surface. Material is a mixture of saturated debris, including soil weathered rock, mud, boulders, and vegetative debris.		14	119	4	
HB27900338	Terrain	Slide	Debris Translational	Downslope movement of a mixture of saturated debris, including soil, weathered rock, mud, boulders, and vegetative debris on a surface which is roughly parallel to the ground surface.		14	120	4	
HB27900110	CCSM	Slide	Mud	Downslope movement of mainly mud material.		14	121	4	
HB27900120	CCSM	Slide	Rock	Downslope movement of mainly rock material.		14	122	4	
HB27900322	Terrain	Slide	Rock Fall	The relatively free falling or precipitous movement of a detached fragment of bedrock from a cliff or other very steep slope.		14	123	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB27900323	Terrain	Slide	Rock Flow	Rapid flow of material dominated by rock.		14	124	4	
HB27900325	Terrain	Slide	Rock Rotational	A landslide in which movement takes place along a well defined, curved shear surface. Material is dominated by rock.		14	125	4	
HB27900327	Terrain	Slide	Rock Topple	Fractured rock failure, usually from a near vertical rock face.		14	126	4	
HB27900328	Terrain	Slide	Rock Translational	Downslope movement of material dominated by rock on a surface which is roughly parallel to the ground surface.		14	127	4	
HB27900340	Terrain	Slide	Soil	Downslope movement of material dominated by soil.		14	128	4	
HB27900343	Terrain	Slide	Soil Flow	Rapid flow of material dominated by soil.		14	129	4	
HB27900345	Terrain	Slide	Soil Rotational	A landslide in which movement takes place along a well defined, curved shear surface. Material is dominated by soil.		14	130	4	
HB27900348	Terrain	Slide	Soil Translational	Downslope movement of material dominated by soil on a surface which is roughly parallel to the ground surface.		14	131	4	
HB27955000	Terrain	Slide Headwall/Scarp		A steep slope at the head of a landslide.		14	132	4	
HB27955119	Terrain	Slide Headwall/Scarp	Indefinite	An unclear steep slope at the head of a landslide.		14	133	4	

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
HB28335000	Terrain	Snow Avalanche		A mass of snow and/or ice, sometimes accompanied by rock and vegetative debris, moving rapidly down slope.		14	134	4	
HB28515000	Terrain	Soil Erosion		The loosening and removal of materials by wind, moving water and glacier ice.		14	135	4	
HB28515110	Terrain	Soil Erosion	Badland	Rough, and steeply gullied topography in arid or semiarid areas, characterised by dry, loose soil. Infrequent, heavy showers cause unchecked erosion of the vegetation-free landscape.		14	136	4	
HB28515120	Terrain	Soil Erosion	Rill	One of the first and smallest channels formed by runoff.		14	137	4	
HB28515130	Terrain	Soil Erosion	Sheet	Overland flow or downslope movement of water taking the form of a thin, continuous film over relatively large area that is not concentrated into channels.		14	138	4	
GF28750000	CCSM	Spring		A place where water flows or springs naturally from rock or soil.	symbol	14	139	4	
HB29785000	Terrain	Striae		Fine cut lines (scratches) on the surface of bedrock or clasts formed by glacial abrasion; oriented parallel to former ice-flow direction.		14	140	4	
HB29785110	Terrain	Striae	Movement Known	Fine cut lines (scratches) on the surface of bedrock or clasts formed by glacial abrasion; oriented parallel to a known former ice-flow direction.		14	141	4	
HB29785119	Terrain	Striae	Movement Unknown	Fine cut lines (scratches) on the surface of bedrock or clasts formed by glacial abrasion; oriented parallel to an unknown former ice-flow direction.		14	142	4	

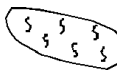

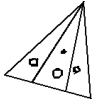

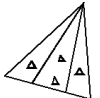

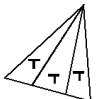

FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOUR	IGDS TYPE	SYMBOL
GA30025000	Terrain	Surface Water Disappearance		The location where surface water disappears.		14	143	4	
AP30300000	CCSM	Mine	Tailing Pile	Refuse material separated as residue in the mining and milling of ore, and deposited in the vicinity of the mine.		14	144	4	
HB30715000	Terrain	Tension Crack		Open fissures in bedrock or surficial materials resulting from tensile stress; typically located at or near the crest of a steep slope, and indicative of potential slope failure.		14	145	4	
GD31025000	Terrain	Tors		A small castellated hill of bedrock with open joint planes rising abruptly from a relatively smooth hilltop or slope; commonly surrounded by fallen blocks.		14	150	4	
HB32850000	CCSM	Volcano				14	151	4	
HB32850001	CCSM	Volcano	Inactive	A vent in the surface of the earth through which magma and associated gases and ash had previously erupted but which is now inactive.		14	152	4	
GE33200110	CCSM	Water Mark	High	The mark left on a shore by the water when at its highest level.		14	153	4	
GE33200120	CCSM	Water Mark	Low			14	154	4	
GF33400000	CCSM	Well	Water		symbol	14	155	4	
GE33200110	CCSM	Water Mark	Inactive	The mark left on a shore by the water when at its highest level.		14	153	4	

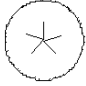

Table 4-11 - Point On Site Symbol Classification Codes.

ARC/INFO FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOR	IGDS TYPE	SYMBOL
AD01000000	CCSM	Archaeological Area				13	1	7	
HB01005000	Terrain	Arete		A narrow, jagged, serrate mountain crest, or a narrow, rocky, sharp-edged ridge or spur, commonly present above the snowline in rugged mountains sculptured by glaciers, and resulting from the continued backward growth of the walls of adjoining cirques.		13	2	7	
HB02105000	Terrain	Block Field		A level or gently sloping area covered with blocks derived from underlying bedrock or drift by weathering and/or frost heave, and having undergone no significant downslope movement; characteristic of periglacial regions.		13	3	7	
HB02485000	Terrain	Boulder Field		A flat or gently sloping area covered with a continuous veneer of large angular and subangular blocks of rock, derived from well-jointed underlying bedrock by intensive frost action and usually occurring in situ on high, flat topped mountains.		13	4	7	
GA03950000	CCSM	Canal				See TRIM IGDS specifications			
HB04600000	CCSM	Cave		A naturally-formed, subterranean open area or chamber, or series of chambers. The implication of size is that it is large enough for a human being to enter. Partial synonym: cavern.	(symbol)	13	6	7	
HB05450000	CCSM	Cinder Cone		A steep-sided conical hill formed by the accumulation of cinders and other pyroclastic deposits around a volcanic vent; normally of basaltic or andestic composition.		13	7	7	

ARC/INFO FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOR	IGDS TYPE	SYMBOL
HB05475000	Terrain	Cirque		A rounded recess in a mountain formed by glacial erosion, with steep head and side walls, and a relatively gently-sloping floor that is commonly a basin with a small lake and terminated down valley by a convex break of slope.		13	8	7	
HB07585000	Terrain	Crag		A streamlined hill consisting of a knob of resistant bedrock.		13	9	7	
FE07885000	Terrain	Cross-Section		A two-dimensional representation through the subsurface.	Sampling layer	13	10	7	
DD08300000	CCSM	Cut Earthwork	Railway			See TRIM IGDS specifications			
DD08350000	CCSM	Cut Earthwork	Road	An excavation made to allow the level or nearly level passage of a road or track through a hill. See also 'fill'.		See TRIM IGDS specifications			
GA08450000	CCSM	Dam	section. Top	A barrier to prevent the flow of water, or to raise and control the level of water by forming a reservoir.		See TRIM IGDS specifications			
GA08800000	CCSM	Ditch		A trench dug in the earth, as for drainage or irrigation.		See TRIM IGDS specifications			
HB09050000	CCSM	Drumlin		A streamlined hill or ridge of till or other drift, with a long axis that parallels the direction of former ice flow; generally the upstream end is widest and highest, and the drumlin tapers in the downflow direction.		13	15	7	
GB09150000	CCSM	Dugout		Any shallow artificial pond or other water filled excavation.		13	16	7	
HB09250000	CCSM	Dune		A low ridge, hummock, or mound of loose sandy material transported and deposited by wind.		13	17	7	

ARC/INFO FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOR	IGDS TYPE	SYMBOL
HB09250001	CCSM	Dune	Inactive	A stabilized, low ridge, hummock, or mound of loose sandy material transported and deposited by wind.		13	18	7	
DD09900000	CCSM	Embankment Fill	Railway			See TRIM IGDS specifications			
DD09950000	CCSM	Fill Embankment	Road			See TRIM IGDS specifications			
HB10150000	CCSM	Escarpment		A steep slope that is usually of great lateral extent compared to its height, such as the risers of river terraces and steep faces associated with stratified rocks.		13	21	7	
HB10150310	Terrain	Escarpment	Bedrock - definite	A clear and obvious line of bedrock cliffs or bluffs produced by faulting or by erosion.		13	22	7	
HB10150319	Terrain	Escarpment	Bedrock - indefinite	An unclear line of bedrock cliffs or bluffs produced by faulting or by erosion.		13	23	7	
HB10150320	Terrain	Escarpment	Overburden - definite	A clear and obvious relatively steep and straight, cliff-like face or slope composed of unconsolidated sediment.		13	24	7	
HB10150329	Terrain	Escarpment	Overburden - indefinite	An unclear relatively steep and straight, cliff-like face or slope composed of unconsolidated sediment.		13	25	7	
HB10200000	CCSM	Esker		A sinuous ridge of sand and gravel resulting from deposition by meltwater in a tunnel beneath or within a glacier or ice sheet. The ridges generally trend at right angles to a glacier margin.		13	26	7	

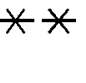

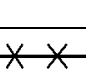

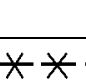

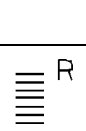

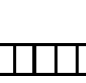

HB10200310	CCSM	Esker	flow known	A sinuous ridge of sand and gravel resulting from deposition by meltwater in a tunnel beneath or within a glacier or ice sheet. The ridges generally trend at right angles to a glacier margin. Flow direction during deposition is known.		13	27	7	
HB10200319	CCSM	Esker	flow unknown	A sinuous ridge of sand and gravel resulting from deposition by meltwater in a tunnel beneath or within a glacier or ice sheet. The ridges generally trend at right angles to a glacier margin but the direction of flow during deposition is unknown.		13	28	7	
GA10450000	CCSM	Falls		A waterfall which in most cases starts with a series of rapids, then goes over a vertical or near vertical drop and ends with a cataract over the debris at the bottom of the drop. Many topographic maps give the height of the vertical drop if over a specific height.	(line)	See TRIM IGDS specifications			
HB10495110	Terrain	Fan	Alluvial	A fan-shaped deposit of fluvial sand and gravel, usually located at the mouth of a tributary valley; a type of floodplain.		13	30	7	
HB10495120	Terrain	Fan	Colluvial	A fan-shaped mass of sediments deposited by colluvial processes, most commonly debris flows.		13	31	7	
HB10495130	Terrain	Fan	Talus Cone	A small, cone-shaped or apron-like landform at the base of a cliff, consisting of poorly sorted talus that has accumulated episodically.		13	32	7	
GD11400000	CCSM	Flow Arrow		An arrow placed on a map to show the direction of flow.		See TRIM IGDS specifications			
HB11775000	Terrain	Fossil		An area in which remains, traces, or imprints of a plant or animal has been preserved by natural processes.		13	34	7	
HB11775110	Terrain	Fossil	Marine	An area in which remains, traces, or imprints of a plant or animal has been preserved by natural processes in a marine environment.		13	35	7	

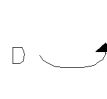

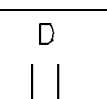

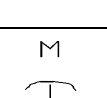

HB11775120	Terrain	Fossil	Terrestrial	An area in which remains, traces, or imprints of a plant or animal has been preserved by natural processes in a terrestrial environment.		13	36	7	
GD12300000	CCSM	Glacier		A body of ice formed by the compaction and recrystallization of snow, that has definite lateral limits, and with motion in a definite direction.		See TRIM IGDS specifications			
HB14315000	Terrain	Ice Contact Delta		An accumulation of stream-transported sediments deposited in a body of water, on or in contact with glacial ice. The landform is flat or very gently sloping, and triangular or fan-shaped in plan.		13	38	7	
HB15065000	Terrain	Kame		Irregular or conical hillocks composed chiefly of sand and gravel; formed by deposition of meltwater-transported sediments in contact with (against, within, or upon) stagnant glacier ice; a type of glaciofluvial deposit.		13	39	7	
HB15125000	Terrain	Kettle Hole		A closed depression or hollow in glacial drift which has resulted from the melting of a buried or partly buried mass of glacier ice; common in glaciofluvial deposits.		13	40	7	
GB15250000	CCSM	Lagoon		A small narrow stretch of sea water separated or partly separated from the ocean by a low, narrow, elongate strip of land.		13	41	7	
GB15300000	CCSM	Lake	Definite	A large, inland body of salt or fresh water, entirely surrounded by land. Larger than a pond.		See TRIM IGDS specifications			
GB15300120	CCSM	Lake	Dry	A lake bed from which all water has drained or evaporated.		See TRIM IGDS specifications			
GB15300140	CCSM	Lake	Intermittent			See TRIM IGDS specifications			
HB15850000	CCSM	Lava Bed		A landform area covered with lava.		13	45	7	
HB16415110	Terrain	Linear Feature	Direction Known	A feature arranged in a line or lines.		13	46	7	

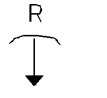

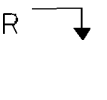

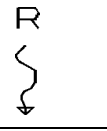

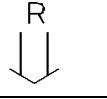

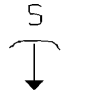

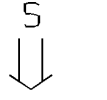

HB16415119	Terrain	Linear Feature	Direction Unknown	A feature arranged in a line or lines.		13	47	7	
GC17100000	CCSM	Marsh		A water-saturated, poorly drained area, intermittently, or permanently water covered, having aquatic and grasslike vegetation, essentially without trees and without peat like accumulation. See also Bog, Fen.	area outline	See TRIM IGDS specifications			
HB17275110	Terrain	Meltwater Channel	Definite	A channel or valley formed or followed by a glacial meltwater stream.		13	49	7	
HB17275119	Terrain	Meltwater Channel	Indefinite	A channel or valley formed or followed by a glacial meltwater stream.		13	50	7	
HB17275120	Terrain	Meltwater Channel	Lateral, Definite	A channel or valley formed or followed by a glacial meltwater stream.		13	51	7	
HB17275129	Terrain	Meltwater Channel	Lateral, Indefinite	A channel or valley formed or followed by a glacial meltwater stream.		13	52	7	
HB17275130	Terrain	Meltwater Channel	Left Bank	A channel or valley formed or followed by a glacial meltwater stream.		13	53	7	
HB17275140	Terrain	Meltwater Channel	Right Bank	A channel or valley formed or followed by a glacial meltwater stream.		13	54	7	
HB17275150	Terrain	Meltwater Channel	Subglacial, Definite	A channel or valley formed or followed by a glacial meltwater stream.		13	55	7	
HB17275159	Terrain	Meltwater Channel	Subglacial, Indefinite	A channel or valley formed or followed by a glacial meltwater stream.		13	56	7	

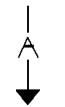

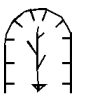

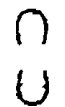

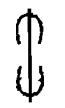

AG17600000	CCSM	Mine	Open Pit	A pit or excavation from which ores, coal, etc. are taken by digging. A open pit mine is generally larger and deeper than a quarry.		13	57	7	
AG17700000	CCSM	Mine	Strip			13	58	7	
AP30300000	CCSM	Mine	Tailing Area	Refuse material separated as residue in the mining and milling of ore, and deposited in the vicinity of the mine.		13	128	7	
AB17500000	CCSM	Mine	Underground			13	59	7	
AB17500001	CCSM	Mine	Underground Abandoned			13	60	7	
CG17800000	CCSM	Mine Entrance	Adit	A near horizontal passage from the surface into a mine.		13	61	7	
CG17800001	CCSM	Mine Entrance	Adit Abandoned			13	62	7	
CG17900000	CCSM	Mine Shaft		A vertical or inclined excavation through which a mine is worked.		13	63	7	
CG17900001	CCSM	Mine Shaft	Abandoned			13	64	7	
HB18700000	CCSM	Moraine		A landform that consists of till or, less commonly of other drift; it exhibits a variety of shapes, ranging from plains to mounds and ridges, that are initial constructional forms independent of underlying bedrock or older materials.		13	65	7	
HB18700110	CCSM	Moraine	Lateral	A ridge built along the side of a valley glacier.		13	66	7	
HB18700119	CCSM	Moraine	Lateral Indefinite	An indefinite ridge built along the side of a valley glacier.		13	67	7	
HB18700120	CCSM	Moraine	Medial	A morainal ridge in the middle of a glacier, parallel to the direction of glacier flow, and formed by the union of lateral moraines of two coalescing glaciers.		13	68	7	

HB18700129	CCSM	Moraine	Medial Indefinite	An indefinite morainal ridge in the middle of a glacier, parallel to the direction of glacier flow, and formed the by the union of lateral moraines of two coalescing glaciers.		13	69	7	
HB18700130	CCSM	Moraine	Terminal	The end moraine that marks the furthest point reached by an advancing glacier.		13	70	7	
HB18700139	CCSM	Moraine	Terminal Indefinite	The indefinite end moraine that marks the furthest point reached by an advancing glacier.		13	71	7	
HB19265110	Terrain	Occurrence / Concentration	Gravel			13	72	7	
HB19265120	Terrain	Occurrence / Concentration	Peat	A concentration of semi-carbonized plant remains.		13	73	7	
HB19265130	Terrain	Occurrence / Concentration	Sand	A concentration of sand particles between 0.62-2 mm.		13	74	7	
GD21065000	Terrain	Permafrost		Ground in which temperature has remained below 0 degrees Celsius continuously for at least 2 years, regardless of type of material or water content; a thermal condition.		13	75	7	
HB21515000	Terrain	Piping		Subsurface erosion of particulate materials by flowing water, resulting in the formation of underground caves and conduits and the development of collapse-depressions at the land surface.		13	76	7	
AG21550000	CCSM	Pit	Gravel Sand	An excavation where sand or gravel has been removed for use in construction. It is not used in Canada as a synonym for coal mine. A borrow pit is the excavation left when earth or sand have been removed.		13	77	7	
AG21550001	CCSM	Pit	Abandoned			13	78	7	
AG21550110	CCSM	Pit	Gravel	An open pit where gravel is mined.		13	79	7	

AG21550120	CCSM	Pit	Sand	An open pit where sand is mined.		13	80	7	
AG21550130	CCSM	Pit	Shale			13	81	7	
AG22450000	CCSM	Quarry	Dry	An open excavation for which building stone, slate etc. is obtained.		13	82	7	
GB22500000	CCSM	Quarry	Water Filled			13	83	7	
HB23050000	CCSM	Raised Beach/Strand Lines		An ancient beach occurring above the present shoreline and separated from the present beach as a result of terrain uplift or the lowering of the sea or lake level.		13	84	7	
HB23050310	Terrain	Raised Beach/Strand Line	Definite	An obvious abandoned shoreline.		13	85	7	
HB23050319	Terrain	Raised Beach/Strand Line	Indefinite	An indefinite abandoned shoreline.		13	86	7	
GA23500000	CCSM	Rapids		A fast flowing section of a watercourse generally with exposed rocks or boulders.	(line)	See TRIM IGDS specifications			
GA24850310	Terrain	River/Stream	Gully	A small valley or ravine, longer than wide, and typically from a few metres to a few tens of metres across.		13	88	7	
HB25335000	Terrain	Roche Moutonee		A knob of rock with a whale-back form, the long axis of which is oriented parallel to former ice flow, and having a smooth, glacially-abraded stoss (up-flow) slope and a much steeper and rougher, glacially-plucked lee slope.		13	89	7	

GD25375000	Terrain	Rock Glacier		A tongue shaped or lobate, ridged accumulation of angular rock fragments containing interstitial ice that moves slowly downslope; morphologically similar to a glacier.		13	90	7	
HB25400000	CCSM	Rock Outcrop		A portion on the surface where one or more bedrock geological formations are exposed.		13	91	7	
HB25745000	Terrain	Sackung	Sagging Slope	Uphill-facing scarps on mountain sides that trend parallel to contours and developed as a result of gravitational movement.		13	92	7	
HB27550000	CCSM	Sinkhole		A funnel shaped depression in the land surface that communicates with a subterranean passage developed by solution, common in limestone and karst regions.	(symbol)	13	99	7	
HB27900000	CCSM	Slide		A landform feature consisting of a descent of a mass of earth or rock.	(area outline)	13	100	7	
HB27900330	Terrain	Slide	Debris	Downslope movement of a mixture of saturated debris, including soil, weathered rock, mud, boulders, and vegetative debris.		13	101	7	
HB27900333	Terrain	Slide	Debris - Flow	Rapid flow of a mixture of saturated debris, including soil, weathered rock, mud, boulders, and vegetative debris.		13	102	7	
HB27900335	Terrain	Slide	Debris - Rotational	A landslide in which movement takes place along a well defined, curved shear surface. Material is a mixture of saturated debris, including soil, weathered rock, mud, boulders, and vegetative debris.		13	103	7	
HB27900338	Terrain	Slide	Debris - Translational	Downslope movement of a mixture of saturated debris, including soil, weathered rock, mud, boulders, and vegetative debris on a surface which is roughly parallel to the ground surface.		13	104	7	
HB27900110	CCSM	Slide	Mud	Downslope movement of mainly mud material.		13	105	7	

HB27900120	CCSM	Slide	Rock	Downslope movement of mainly rock material.		13	106	7	
HB27900322	Terrain	Slide	Rock - Fall	The relatively free falling or precipitous movement of a detached fragment of bedrock from a cliff or other very steep slope.		13	107	7	
HB27900323	Terrain	Slide	Rock - Flow	Rapid flow of material dominated by rock.		13	108	7	
HB27900325	Terrain	Slide	Rock Rotational	A landslide in which movement takes place along a well defined, curved shear surface. Material is dominated by rock.		13	109	7	
HB27900327	Terrain	Slide	Rock Topple	Fractured rock failure, usually from a near vertical rock face.		13	110	7	
HB27900328	Terrain	Slide	Rock Translational	Downslope movement of material dominated by rock on a surface which is roughly parallel to the ground surface.		13	111	7	
HB27900340	Terrain	Slide	Soil	Downslope movement of material dominated by soil.		13	112	7	
HB27900343	Terrain	Slide	Soil Flow	Rapid flow of material dominated by soil.		13	113	7	
HB27900345	Terrain	Slide	Soil Rotational	A landslide in which movement takes place along a well defined, curved shear surface. Material is dominated by soil.		13	114	7	
HB27900348	Terrain	Slide	Soil Translational	Downslope movement of material dominated by soil on a surface which is roughly parallel to the ground surface.		13	115	7	
HB27955000	Terrain	Slide Headwall/Scarp		A steep slope at the head of a landslide.		13	116	7	
HB27955119	Terrain	Slide	Indefinite	An unclear steep slope at the head of a landslide.		13	117	7	

		Headwall/Scarp							
HB28335000	Terrain	Snow Avalanche		A mass of snow and/or ice, sometimes accompanied by rock and vegetative debris, moving rapidly down slope.		13	118	7	
HB28515000	Terrain	Soil Erosion		The loosening and removal of materials by wind, moving water and glacier ice.		13	119	7	
HB28515110	Terrain	Soil Erosion	Badland	Rough, and steeply gullied topography in arid or semiarid areas, characterized by dry, loose soil. Infrequent, heavy showers cause unchecked erosion of the vegetation-free landscape.		13	120	7	
HB28515120	Terrain	Soil Erosion	Rill	One of the first and smallest channels formed by runoff.		13	121	7	
HB28515130	Terrain	Soil Erosion	Sheet	Overland flow or downslope movement of water taking the form of a thin, continuous film over relatively large area that is not concentrated into channels.		13	122	7	
GF28750000	CCSM	Spring		A place where water flows or springs naturally from rock or soil.	(symbol)	13	123	7	
HB29785000	Terrain	Striae		Fine cut lines (scratches) on the surface of bedrock or clasts formed by glacial abrasion; oriented parallel to former ice-flow direction.		13	124	7	
HB29785110	Terrain	Striae	Movement Known	Fine cut lines (scratches) on the surface of bedrock or clasts formed by glacial abrasion; oriented parallel to a known former ice-flow direction.		13	125	7	
HB29785119	Terrain	Striae	Movement Unknown	Fine cut lines (scratches) on the surface of bedrock or clasts formed by glacial abrasion; oriented parallel to an unknown former ice-flow direction.		13	126	7	
GA30025000	Terrain	Surface Water Disappearance		The location where surface water disappears.		13	127	7	

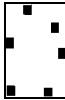

HB30715000	Terrain	Tension Crack		Open fissures in bedrock or surficial materials resulting from tensile stress; typically located at or near the crest of a steep slope, and indicative of potential slope failure.		13	129	7	
GD31025000	Terrain	Tors		A small castellated hill of bedrock with open joint planes rising abruptly from a relatively smooth hilltop or slope; commonly surrounded by fallen blocks.		13	130	7	
HB32850000	CCSM	Volcano				13	131	7	
HB32850001	CCSM	Volcano	Inactive	A vent in the surface of the earth through which magma and associated gases and ash had previously erupted but which is now inactive.		13	132	7	
GE33200110	CCSM	Water Mark	High	The mark left on a shore by the water when at its highest level.		13	133	7	HWL
GE33200120	CCSM	Water Mark	Low			13	134	7	LWL
GF33400000	CCSM	Well	Water		symbol	13	135	7	

Table 4-12 - Polygonal On Site Classification Codes.

ARC/INFO FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOR	IGDS TYPE	SYMBOL
HB02105000	Terrain	Block Field		A level or gently sloping area covered with blocks derived from underlying bedrock or drift by weathering and/or frost heave, and having undergone no significant downslope movement; characteristic of periglacial regions.		15	1	label = 7 arc = 4	
HB02485000	Terrain	Boulder Field		A flat or gently sloping area covered with a continuous veneer of large angular and subangular blocks of rock, derived from well-jointed underlying bedrock by intensive frost action and usually occurring in situ on high, flat topped mountains.		15	2	label = 7 arc = 4	
GB09150000	CCSM	Dugout		Any shallow artificial pond or other water filled excavation.		15	3	label = 7 arc = 4	
HB09250000	CCSM	Dune		A low ridge, hummock, or mound of loose sandy material transported and deposited by wind.		15	4	label = 7 arc = 4	
HB09250001	Terrain	Dune	Inactive	A stabilized, low ridge, hummock, or mound of loose sandy material transported and deposited by wind.		15	5	label = 7 arc = 4	
HB10495110	Terrain	Fan	Alluvial	A fan-shaped deposit of fluvial sand and gravel, usually located at the mouth of a tributary valley; a type of floodplain.		15	6	label = 7 arc = 4	
HB10495120	Terrain	Fan	Colluvial	A fan-shaped mass of sediments deposited by colluvial processes, most commonly debris flows.		15	7	label = 7 arc = 4	
HB10495130	Terrain	Fan	Talus Cone	A small, cone-shaped or apron-like landform at the base of a cliff, consisting of poorly sorted talus that has accumulated episodically.		15	8	label = 7 arc = 4	

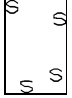

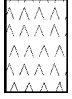

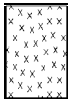

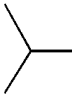

ARC/INFO FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOR	IGDS TYPE	SYMBOL
GB15250000	CCSM	Lagoon		A small narrow stretch of sea water separated or partly separated from the ocean by a low, narrow, elongate strip of land.		15	9	label = 7 arc = 4	
GB15300000	CCSM	Lake	Definite	A large, inland body of salt or fresh water, entirely surrounded by land. Larger than a pond.		See TRIM IGDS specifications			
GB15300120	CCSM	Lake	Dry	A lake bed from which all water has drained or evaporated.		15	11	label = 7 arc = 4	
GB15300140	CCSM	Lake	Intermittent			See TRIM IGDS specifications			
HB15850000	CCSM	Lava Bed		A landform area covered with lava.		15	13	label = 7 arc = 4	
GC17100000	CCSM	Marsh		A water-saturated, poorly drained area, intermittently, or permanently water covered, having aquatic and grasslike vegetation, essentially without trees and without peat like accumulation. See also Bog, Fen.	(area outline)	See TRIM IGDS specifications			
GD21065000	Terrain	Permafrost		Ground in which temperature has remained below 0 degrees Celsius continuously for at least 2 years, regardless of type of material or water content; a thermal condition.		15	15	label = 7 arc = 4	
HB25400000	CCSM	Rock Outcrop		A portion on the surface where one or more bedrock geological formations are exposed.		15	16	label = 7 arc = 4	
AP30300000	CCSM	Mine	Tailing Area	Refuse material separated as residue in the mining and milling of ore, and deposited in the vicinity of the mine.		See TRIM IGDS specifications			

Table 4-13 - Linear Sample Site Classification Codes

ARC/INFO FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOR	IGDS TYPE
FE25755000	Terrain	Sample Site		The site of a geologic observation.	Sampling layer	14	109	4
FE25755110	Terrain	Sample Site	Age dating	The site of a sample for age dating.	Sampling layer	14	110	4
FE25755120	Terrain	Sample Site	Air	The site of an observation made from the air.	Sampling layer	14	111	4
FE25755130	Terrain	Sample Site	Bore Hole/Pit	The site of a borehole excavation.	Sampling layer	14	112	4
FE25755140	Terrain	Sample Site	Ground	The site of an observation, sample or test made on the ground.	Sampling layer	14	113	4
FE25755150	Terrain	Sample Site	Stratigraphic Section	Any sequence of rock or unconsolidated sediment units, either at or below the surface.	Sampling layer	14	114	4

Table 4-14 - Point Sample Site Classification Codes

ARC/INFO FCODE	SOURCE	FEATURE	ATTRIBUTE	DESCRIPTION	REMARKS	IGDS LEVEL	IGDS COLOR	IGDS TYPE
FE25755000	Terrain	Sample Site		The site of a geologic observation.	Sampling layer	13	93	7
FE25755110	Terrain	Sample Site	Age dating	The site of a sample for age dating.	Sampling layer	13	94	7
FE25755120	Terrain	Sample Site	Air	The site of an observation made from the air.	Sampling layer	13	95	7
FE25755130	Terrain	Sample Site	Bore Hole/Pit	The site of a borehole excavation.	Sampling layer	13	96	7
FE25755140	Terrain	Sample Site	Ground	The site of an observation, sample or test made on the ground.	Sampling layer	13	97	7
FE25755150	Terrain	Sample Site	Stratigraphic Section	Any sequence of rock or unconsolidated sediment units, either at or below the surface.	Sampling layer	13	98	7

4.2.4 Terrain Polygon Attributes

Terrain polygon attributes can be captured using the attribute form described in section 2 of this manual or with the data capture utility that will be available from the Wildlife Branch of the Ministry of Environment Lands and Parks. This data is stored in a database which is described in detail in section 5. This aspatial data is linked to the spatial data by a key called “ter_tag”. Ter_tag is a unique identifier consisting of the project number, mapsheet number, and terrain polygon number.

In IGDS files this unique key must be stored in the textnode for the terrain polygons being mapped. In ARC/INFO “ter_tag” is a field on the polygon attribute table of the ter_<project_name> coverage.

The Terrain Attribute data must be delivered in a CSV flat file format. The contents, and format, of this file is discussed in detail in section 2.

4.3 Coordinate System

The standard position of a point on the earth's surface is located by its coordinates. These coordinates can be expressed as spherical or planar coordinates. The first method specifies location in terms of a spheroid (real world coordinates) using latitude, longitude as units of measure. Latitude and longitude represent the x and y positioning of a geographic feature based on the horizontal datum, and must be stated in degrees or portions of degrees. Alternatively, data may be stored in planar coordinates, such as metres, by projecting the data to a flat two dimensional surface. Terrain data may be delivered in the coordinate systems outlined in tables 4-15 and 4-16.

Table 4-15 - IGDS Coordinate Systems

IGDS parameters	Geographic	UTM	BC Albers
Unit of Resolution	impractical	cm	cm
Measurement Unit		metre	metre
X,Y Offsets		0, 0	0, 0

Table 4-16 - ARC/INFO Coordinate Systems

ARC/INFO parameters	Geographic	UTM	BC Albers
Unit of Resolution	decimal degrees, double precision	metres, single precision	metres, single precision
Measurement Unit	decimal degrees, double precision	metres	metres
X,Y Offsets	None	0, 0	0, 0

4.3.1 Datum

The NAD83 datum must be used for all data delivered to the terrain data custodian unless specified by the data custodian. **NAD83** - North American Datum 1983, earth-centred ellipsoid derived from Geodetic Reference System 1980 (GRS80)

NAD27 - North American Datum 1927, based on the Clarke Spheroid of 1866.

4.3.2 Projection

All data must be delivered in one of the following map projections.

Spherical - **Geographic** (Lat/Long)

Rectangular - **UTM, Albers(BC)**

TM - Universal Transverse Mercator is the ellipsoidal Transverse Mercator projection with specific parameters pre-defined. British Columbia spans UTM zones 7-11, each zone is 6 degrees of longitude in width, the central meridian being the longitude at the midpoint of the 6 degree span. Rectangular coordinates are metric with Easting values offset by 500,000 metres.

Albers (British Columbia) - This projection pre-defines specific parameters for use with the Albers Equal Area Conic projection. For British Columbia these parameters have been defined as:

central meridian	126° 0' 0"
1 st standard parallel	50° 0' 0"
2 nd standard parallel	58° 30' 0"
latitude of origin	45° 0' 0"

Rectangular coordinates are metric with Easting values offset by 1,000,000 metres.

4.3.3 NAD27 - NAD83 Conversion

Data which has been upgraded to the new datum must provide the method of transformation. It is recommended that transformation of data captured for use at scales of 1:50 000 and larger use the National Transformation Grid Version 2.0. If the National Transformation Grid Version 1.1 has been used it must be noted in the specification.

NOTE: When compared to Version 1.1, Version 2.0 of the National Transformation Grid provides greater detail in urban areas and more accurate control in pockets of the northeast of the province. This will only be significant at scales of 1:20 000 and larger.

Reference:

Standard for the Use of Map Projections in British Columbia for Resource, Cultural and Heritage Inventories

Resources Inventory Committee, September, 1996

For further information on NAD27, NAD83 and the National Transformation Grid contact:

Geospatial Reference Section
GDBC,
Ministry of Environment, Lands and Parks,
Province of British Columbia

4.3.4 Registration

All mapping must be tied to the following baseline data:

Choices: Provincial Baseline Digital Atlas 1:20 000 (TRIM)

4.3.5 Base Positional Accuracy

Provincial Baseline Digital Atlas 1:20 000 (TRIM) -

90% of all well defined planimetric features shall be coordinated to within 10 metres of their true position.

90% of all discrete spot elevations and DEM points shall be accurate to within 5 metres of their true elevation.

90% of all points interpolated from the TRIM (including contour data) shall be accurate to within 10 metres of their true elevation.

True position/elevation is defined as the coordinates which would be obtained from positioning with high order ground methods.

4.3.6 Data Extents

The geographic extent of terrain data being captured need not match any particular mapsheet boundary. Each coverage may cover as large, or small, an area as needed. Assembling large areas into continuous coverage's reduces the potential for edge-matching errors. These areas may be defined by specific areas of interest e.g. forest districts or watersheds if desired.

4.3.7 Data Format

Terrain data will be accepted by the Terrain Data Custodian in the following formats.

ARC/INFO export (single precision, uncompressed)

IGDS

4.3.8 Coverage or Layer Naming Conventions

Terrain features may be stored in as many as four ARC/INFO coverages or a single IGDS design file. Each ARC/INFO coverage contains a different category of terrain data, has a specific name, and requires/contains specific feature attributes as described in Table 4-17.

Table 4-17 - Coverage and Layer Naming Conventions

Data Type	Coverage	IGDS Design file	Attributes Required
Terrain Polygons	ter_ <i>project</i> *	ter_ <i>project</i> .dgn	Polygon and Arc
Point and line on site symbols	tef_ <i>project</i>	ter_ <i>project</i> .dgn	Arc and Point
Area based on site symbols	tea_ <i>project</i>	ter_ <i>project</i> .dgn	Polygon and Arc
Sample Sites	tes_ <i>project</i>	ter_ <i>project</i> .dgn	Arc and Point

* *project* refers to the name of the mapping project. Coverage ter_kalam would contain terrain polygons for the project Kalam.

4.3.9 Minimum Feature Size

This section defines thresholds for each type of feature captured. These thresholds define the point at which i) the geometry of the feature changes, or ii) the feature is not captured.

The minimum size of polygon, line and area features relates to the scale of data capture, which translate into ground coordinates in the coverages themselves. The generally accepted minimums are as follows:

1. **Terrain polygons** – at least 1 cm² at the data capture scale. (see *Guidelines and Standards for Terrain Mapping in BC* (1996), page 19).
2. **Line features** – at least 0.5 cm at the data capture scale. Features smaller than this must be ignored, or represented as point features.
3. **Area features** – at least 0.25 cm at the data capture scale. Features smaller than this must be ignored, or represented as point features.

4.3.10 Data Capture Rules

4.3.10.1 Right-Hand Rule

A line which bounds a polygonal feature must be captured such that the feature lies to the right of the line. Equivalently, the boundary of the feature must be oriented in a clockwise direction.

Applicability: This rule applies to discrete polygon spatial data types only.

4.3.10.2 Downstream Rule

Features having a defined discernible gradient must be digitized, or rotated so it points, in a downstream direction.

Applicability: This rule applies to linear or point spatial data types only.

Example: rivers, glaciers, moraines, slides

4.3.10.3 Pseudo-node Rule

Pseudo-nodes (nodes where only two arcs meet) should be avoided, except where necessary to meet the maximum element size constraints of a particular software product.

4.3.10.4 Undershoot/Overshoot Rule

Polygonal feature classes must not contain undershoots or overshoots (e.g. 1-nodes, or nodes that touch only one arc).

4.3.10.5 Single Inside Point Rule

A polygonal feature must contain only one label point, or text node, located **INSIDE** the polygon

Applicability: This rule applies to all polygonal data.

4.3.10.6 Linear On Site Symbols.

Linear on site symbols should not be broken for other feature groups. Eskers, for example, must be digitized across rivers, kettle holes, etc., and the arcs must not intersect.

4.3.11 Digitizing Accuracy

When mapping terrain in an area which already has accurate digital topographic or base mapping at an appropriate scale (for example, Terrain Resource Inventory Mapping from Geographic Data BC), terrain features should be registered to features in the existing base maps unless the new data is more accurate than the base information. The accuracy of digitized data is related to the scale of the source data. All digitized features must be within 0.5 mm of the original map features when check plotted. Therefore data captured from a 1:20000 base map must be within 10m of its mapped position. If the scale of the source map was 1:50000 data must be within +/- 25 meters of its mapped position. Where the mapping is captured from new terrain surveys, accuracy levels will be specified in the contract.

5. Metadata

Two types of metadata must be collected while mapping terrain data:

1. A record of field mapping information in the header of the RIC Inventory Data Form. This is described in section 2.
2. A record information regarding the digital capture of the data. This information, known as data set metadata, is stored in a metadata table within each data set.

All metadata must be included with all data sets when submitted to the terrain data custodian.

5.1 Data Set Metadata

The instructions in this document may be revised when the BC Government creates a standard for storing metadata, see page iii.

For each spatial data set, there must be an attribute database table named '<dataset_name>.meta', that contains data set metadata.

The table should have two items (columns):

1. **key** : character, 16 wide.
2. **value** : character, 100 wide.

There should be at least four records in the table, with key values of

'TITLE' - Short name for this data.

'DESCRIPTION' - What kind of data is it ?

'SOURCE' - Where did this data come from ?

'ACCURACY' - How well does this data represent the earth ?

Other possible key values are:

'CUSTODIAN' - What person or agency is responsible to update this data set ?

'WARNING' - Any warnings that users should see before they use this data.

'HISTORY' - What is the origin of the data ? What are the important stages/problems/etc. in its history ?

'RESOLUTION' - What is the minimum size of a unit or feature ?

'REGISTRY' - How is it referred to in the corporate metadata repository ? e.g. 'BC Environment Data Registry', followed by the Registry title of this data set.

'PRODUCTION_DATE' - When was it first created in this form? 'MODIFIED' - Date, agency or person, and how it was modified. For example: '07/95 (MELP ISB) Added FCODE symbology.'

'ORACLE_NOTES' - Does it link to Oracle data? How?

'FUTURE' - What changes/additions/etc. are planned for this data and by whom?

'DISTRIBUTION' - What limitations/copyrights are there on distributing it?

6. Quality Assurance Procedures

All digital data must be checked to ensure that:

1. All attributes in all fields are allowable values;
2. All classes and their representation are consistent with the data model, that is each geographic object (class or feature) is represented by the right Geometric Object (point, line, or polygon);
3. All mandatory fields are populated;
4. All digitizing rules have been adhered to;
5. The accuracy of the digital data is acceptable;
6. All linework must be topologically 'clean'. All polygon boundary lines must be broken where they intersect;
7. Dangling arcs must be removed on polygon and region layers;
8. Features and attributes must be edge matched along project or mapsheet boundaries.

Spatial data can be checked with a check plot. The check plot must consist of a symbolised map plotted at the same scale of the source data. It must show all of the features collected and these features must be drawn with the correct symbology. Check plots must be reviewed against the source document to ensure that all features were collected and coded properly.

Terrain attribute data must also be checked. Polygon attributes should be checked to ensure that polygons were given the correct terrain classification. This is best done with another check plot which contains labeled polygons. The attributes themselves must also be checked to ensure that all codes collected are valid. At this time a generic attribute validation program does not exist. The data capture program does however validate data as it is collected. All errors and omissions should be corrected before the data is sent to the terrain database custodian.

6.1 Check Plot Specification

Check plots are usually created to help verify data, but are only one possible output of the digital terrain data specified above.

Over time, the data custodian is expected to develop and provide the following items:

Standard symbology.

Sample output .

ARC/INFO Arc macro language scripts to automate the plotting of:

- Terrain map surround
- Terrain polygon labels
- Terrain map legend
- Sample/observation site labels.

6.1.1 Content

A standard terrain dataset should be plotted as two separate plots on mylar at the same scale:

1. Terrain polygons with labels derived from their attributes (1 coverage);
2. Point, line, and area features, with sample/observation sites (3 coverages).

Though check plots do not necessarily require legends, final map products do.

6.1.2 Extent

Check plots should contain data from complete projects, watersheds or BCGS/NTS mapsheets.

6.1.3 Surround

The surround for the terrain polygon plot should contain:

1. A section on the left or bottom for overflow labels (labels too large to fit into their polygons at the plot scale);
2. A terrain polygon legend, which can be derived from the polygons, their attributes, and attributes of their project. It can include a key containing a lookup table matching attribute codes to full names for all codes used in the polygon labels. Some legends may contain all 'generic' or 'comprehensive' codes for terrain mapping;
3. A section for project-specific notes compiled for polygons represented on the plot;
4. A title box;
5. An index map.

The end of this section contains some example templates for map sizes (with considerations for plotter dimensions, reproduction, cabinet storage), surround layout and information requirements. For a sample surround and legend, see pages 53, 54 and 58 Guidelines and Standards for Terrain Mapping in BC (1996).

6.1.4 Symbology

ARC/INFO symbols sets, and lookup tables, are available for terrain mapping. They can be downloaded from <http://ftp.env.gov.bc.ca/dist/arcinfo/terrain>. Symbology using true type fonts is being developed but as of June 25, 1997 is not yet available. Symbology is defined in 'plotter' units so that one set of symbology is usable for datasets of any scale, so long as the data density is appropriate.

6.1.5 Registration Grid

A coordinate reference should be plotted for assistance with registration. This may consist of grid lines or ticks in longitude/latitude and/or UTM coordinates. It should extend over the entire map surface.

6.1.6 Annotation Text

This mapping contains no annotation text.

6.1.7 Terrain Polygon Labels

Depending on project specifications, terrain polygon labels may contain indicators of:

Terrain components 1, 2, and 3.

Drainage.

Slope.

Slope stability.

Geomorphological processes.

TERTAG field (see section 4, 'Attribute Tables').

The algorithm for generating these labels will not be undertaken do to maintainence concerns.

6.1.8 Terrain Polygon Symbols - Labeling Suggestions

The label examples below include the ‘standard look’ of terrain labels commonly used on terrain maps. Refer to Howes and Kenk Version 2.0 for further label examples.

The labels have a standard format in terms of the order of elements; the texture symbols (sg) always precede the ‘surficial material’ (M) and the surface expression (bv) always follows the surficial material, for example **sgFGbv** (in Arial font); **sgFGbv** (in Univers font).

Simple terrain labels

Code	Description
Mb	morainal blanket
Mb/Cv	morainal blanket is the dominant material in the polygon and colluvial veneer is the subdominant material, they are separated by a single delimiter.
6Mb 4Cv m,w	similar to b) but the components are apportioned by percentiles used in ‘terrain mapping for ecosystems’, this convention also classifies and labels soils drainage classifications.

Complex terrain labels

Code	Description
sgFGb/gCk/sFAp - B	the ‘G’ and ‘A’ qualifiers can now be recorded in a ‘straight line’ instead of a superscript.
7arCv 3rsMv - C Rk Rm	the line between the symbols, indicating stratigraphy should be recorded, however if the underlying surficial material is located directly below the upper surficial material the reader should understand this convention - if explained in the legend and does not conflict with other symbols, see f)
7arCv 3rsMv - C Rk Rm	
doRm // Cxv	a bedrock type (dolomite ‘do’ in this case) can be recorded before the ‘R’ bedrock symbol.
Rs . Cv - VARd 5 w V	a terrain slope stability symbol set; terrain, slope class (5), drainage (w), and slope stability symbol (V) class 5.

6.1.9 Fonts and Symbol Placement:

The fonts for the labels should consider ‘plain’ letter types to allow for photo copy reductions without losing part of the type and to allow for space between the letters and clarity with each letter type i.e. avoid ‘i’s which look like ‘l’s.

ARC/INFO has the following preferred fonts, ‘Univers Medium’ and ‘Trimvirate’; other closely similar fonts such as Helvetica are suitable.

Symbol placement, the labels can be reduced in size and rotated to fit the polygon configurations. In tight situations labels can be placed in a overflow galley, but must have a numeric identifier, polygon number, both in the polygon and with the label. But marginal overflows make the map reading more difficult.

6.1.10 Sample/Observation Site labels

Sample/observation site labels should contain appropriate indicators from the sample/observation site attribute database.

Figure 6-1- Example Map Surround 1:20,000

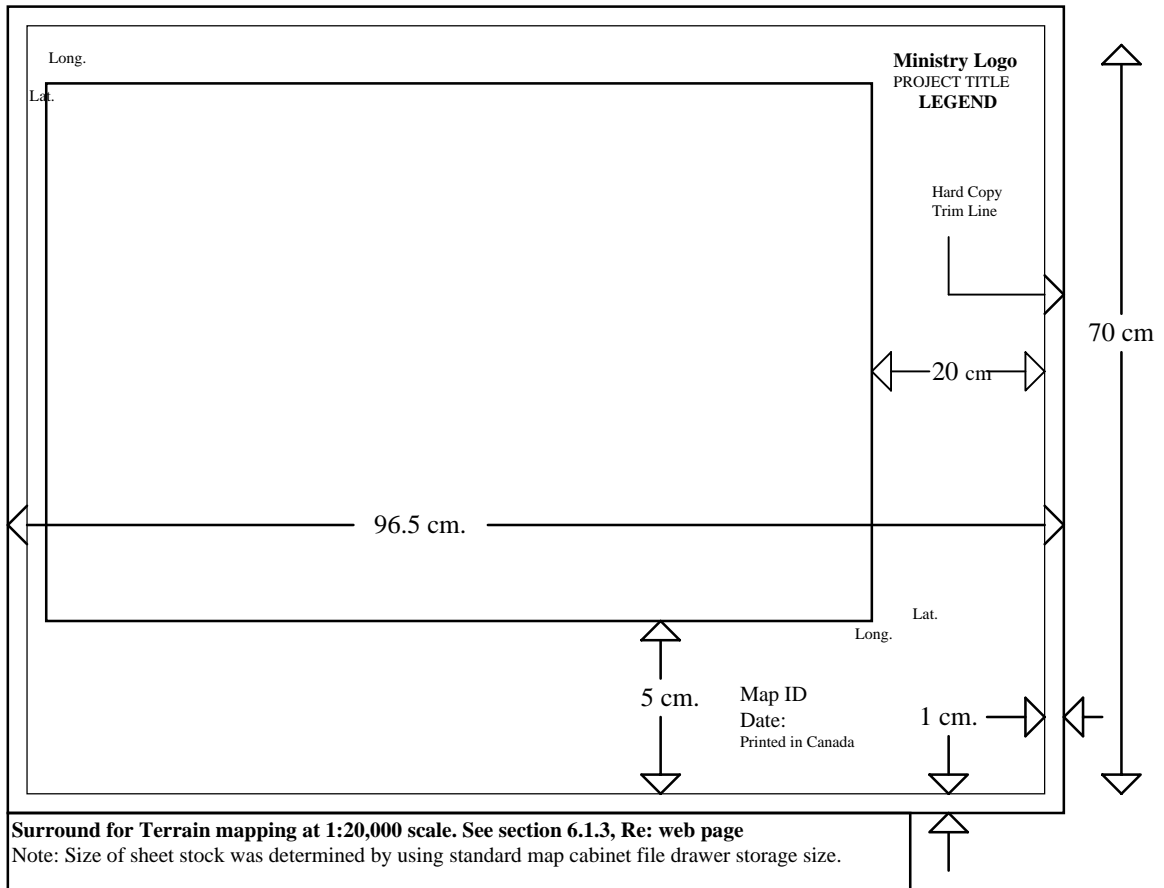

Figure 6-2 - Example Map Surround 1:50,000

APPENDICES

Appendix 1 - Contact List (1998)

Primary Contacts for Direction

Geological Survey Branch, Ministry of Employment and Investment

Peter Bobrowsky
Quaternary Geologist
Head Surficial Geology Section
Geological Survey Branch
1810 Blanshard St.
Victoria BC, V8V 1X5
(250)952 0395
pbobrowsky@galaxy.gov.bc.ca

Ward Kilby
Geologist, Manager-Mineral Potential
Terrain Data Custodian
Geological Survey Branch
5th Floor
Ministry of Employment and Investment
1810 Blanshard Street
Victoria BC, V8V 1X5
(250)952 0422
ward.kilby@gems6.gov.bc.ca

Ian Webster
Geologist
Assistant Terrain Data Custodian
Geological Survey Branch
5th Floor
Ministry of Employment and Investment
1810 Blanshard Street
Victoria BC, V8V 1X5
(250)952-0433
Ian.Webster@gems1.gov.bc.ca

Ministry of Environment, Lands and Parks, Terrain Advisors

Tony Cheong
Senior Geomorphologist
Inventory and Data Systems, Fisheries Branch
Ministry of Environment, Lands and Parks
1-780 Blanshard St.
Victoria BC, V8V 1X4
(250)387 9597
tcheong@fwhdept.env.gov.bc.ca

Larry Lacelle
(Bioterrain Corelator)
Wildlife Inventory Section
Resource Inventory Branch
Ministry of Environment, Lands and Parks
201-3547 Skaha Rd..
Penticton BC, V2A 7K2
(250)490-8246
llacelle@fwhdept.env.gov.bc.ca.

Bruce Thomson
Geomorphologist
Planning and Assessment
Ministry of Environment, Lands and Parks
10334 152A St.
Surrey BC, V3R 7P8
(604)582 5200

Bob Maxwell
(Bioterrain)
Wildlife Inventory Section
Resource Inventory Branch
Ministry of Environment, Lands and Parks
2975 Jutland Road, Victoria, BC V8T 9M1
(250)387 9783
bmaxwell@fwhdept.env.gov.bc.ca

Data and GIS Advisors

Bruce Mackenzie,
Senior Technical Analyst
Information Services Branch
Ministry of Environment, Lands and Parks
2975 Jutland Road, Victoria, BC V8T 9M1

(250)387 9614
bmackenz@ssbpost.env.gov.bc.ca

Darren McKellar
Wildlife Inventory Section
Resource Inventory Branch
Ministry of Environment, Lands and Parks
2975 Jutland Road, Victoria, BC V8T 9M1

(250)356-5072
dmckellar@fwhdept.env.gov.bc.ca

Evert Kenk
Head, LandData BC
Geomatics Branch
Ministry of Environment Lands and Parks
1802 Douglas Street
Victoria BC, V8V 1X4

(250)387 9309
ekenk@galaxy.gov.bc.ca

Ministry of Forests

Jim Schwab
Regional Geomorphologist
BC Ministry of Forests
Prince Rupert Forest Region
Bag 5000 3726 Alfred St.
Smithers BC, V0J 2N0

(250)847 7435

Tim Giles
Research Geomorphologist
Kamloops Forest District
515 Columbia St.
Kamloops BC, V2C 2T7

(250)371 3708

Steve Chatwin
Geomorphologist
BC Ministry of Forests
31 Bastion, Victoria, BC V8W 3E7

(250)387-5887

Peter Jordan
Research Geomorphologist

Appendix 2 - Project specific Data capture

Many terrain projects are likely to have project specific attributes. These attributes are not within the standards for digital terrain capture and will not be systematically stored in the provincial data warehouse. However, consulting companies, regions and districts can store and manage this data for their specific applications. At this time the data warehouse will look into storing this data in flat file format only.

With respect to slope classes; the slope tables recorded below provide a format and guide as to how companies can enter their own specific slope classes. However, being that the relationship of slope classes to local and regional topographies can vary, mappers must therefore set their own class limits.

The provincial terrain database committee prefers that mappers record the actual numeric value of slopes within polygons, this way the information is more definitive and suitable for interpretations. This is the reason the slope class tables were removed from the database standards and placed in into the project specific level.

Terrain Data Form Field Name	Coding Instructions	Field Length	Field Descrip	CSV Attribute Name
Slope Class 1	The dominant slope class of a polygon, by recording a class 1,2,3,4 or 5. From "Terrain Geology Mapping" (RIC Jan. 1996). See Table 6-1.	1	n-x-r	Slpc_1
Slope Class Relation	A slope class separator used to show the relation between two slope classes. See Table 6-2.	1	c-x-r	Slpc_Rel
Slope Class 2	The subdominant slope class of a polygon, by recording a class 1,2,3,4 or 5. From "Terrain Geology Mapping" (RIC Jan. 1996). See Table 6-1.	1	n-x-r	Slpc_2

Table 6-1 - Slope Classes^{1 2 3}

Code	Class Name	Definition - Mapper to define their own class limits
1	Slope Class 1	E.g. only (0-5 percent; 0-3 degrees)
2	Slope Class 2	E.g. only (6-27 percent; 4-15 degrees)
3	Slope Class 3	E.g. only (28-49 percent; 16-26 degrees)
4	Slope Class 4	E.g. only (50-70 percent; 27-35 degrees)
5	Slope Class 5	E.g. only (>70 percent; >35 degrees)
<p>¹ Slope class limits must be determined on a project specific basis.</p> <p>² The primary reference base is degrees as the conversion to %'s is not exact in this class table. For very detailed slope measurements and recordings in the 'terrain data base', as for detailed terrain stability work, it is best to refer to the contract specifications and the regional terrain authority.</p> <p>³ Mappers are encouraged to record a minimum and maximum slope. Ex. 35-50% for each polygon. Slope classes can then be prepared from those numbers.</p>		

Table 6-2 - Slope Class Separators

Code	Class Name	Definition
,	slope class relation	A slope class separator used to show the relation between two slope classes. A comma indicates two distinct slope classes exist in a polygon.
-	slope class relation	A slope class separator used to show the relation between two slope classes. A dash indicates that all intermediate classes exist between the two slope classes recorded.
