.....

Equation 3.1 Plant Water Requirement

$$G/P/D = 0.623 \times ET \times S \times A \times K \quad \text{Page \# 13}$$

where:

| | | |
|-------|---|---|
| G/P/D | = | Gallons (U.S.) per plant per day |
| 0.623 | = | 27,152 gal/ac-in 43,560 ft ² /acre |
| ET | = | Peak evapotranspiration rate for location (in/day) (Table 2.1) |
| S | = | Effective soil water storage factor (decimal) (Table 3.4) |
| A | = | Plant area (ft ²) – calculated from plant spacing |
| K | = | Crop coefficient factor (Table 3.5) (decimal) |

Two factors that require further explanation are the effective soil water storage factor (S) and the crop coefficient factor (K).

Equation 3.2 Trickle System Design Requirement

$$TC = \frac{G/P/D \times L}{E \times Eu} \quad \text{Page \# 22}$$

where:

| | | |
|-------|---|--|
| TC | = | Trickle system design capacity |
| G/P/D | = | Plant water requirement |
| L | = | Leaching factor (Table 3.7) |
| E | = | Application efficiency (decimal) (Table 3.8) |
| Eu | = | Emission uniformity (decimal) |

Equation 4.1 Emitter Flow Rate

| | | | | | | | | | | | | | | |
|--------|---|--|-----|-----------------|-----|-----|--------------------------|-------|-----|--|-----|-----|----------------------------|--|
| | $Q = K_d (P)^x$ | Page # 31 | | | | | | | | | | | | |
| where: | <table style="width: 100%; border: none;"> <tr> <td style="width: 10%;">Q</td> <td style="width: 5%;">$=$</td> <td>Flow Rate (gph)</td> </tr> <tr> <td>P</td> <td>$=$</td> <td>Operating pressure (psi)</td> </tr> <tr> <td>K_d</td> <td>$=$</td> <td>Constant depending on the emitter and orifice size</td> </tr> <tr> <td>x</td> <td>$=$</td> <td>Emitter discharge exponent</td> </tr> </table> | Q | $=$ | Flow Rate (gph) | P | $=$ | Operating pressure (psi) | K_d | $=$ | Constant depending on the emitter and orifice size | x | $=$ | Emitter discharge exponent | |
| Q | $=$ | Flow Rate (gph) | | | | | | | | | | | | |
| P | $=$ | Operating pressure (psi) | | | | | | | | | | | | |
| K_d | $=$ | Constant depending on the emitter and orifice size | | | | | | | | | | | | |
| x | $=$ | Emitter discharge exponent | | | | | | | | | | | | |

Equation 4.2 Emitter Discharge Exponent

| | | |
|--|---|------------------|
| | $x = \frac{\log \left(\frac{Q_1}{Q_2} \right)}{\log \left(\frac{P_1}{P_2} \right)}$ | Page # 31 |
| | <p>Where Q_1 and Q_2 are emitter flow rates measured at pressures P_1 and P_2 respectively.</p> | |

Equation 4.3 Emission Uniformity Using Flow Rate

| | | | | | | | | | | | | | | | | | |
|--------|---|--|-----|----------------------------------|-----|-----|--|-------|-----|--|-------|-----|--|-------|-----|--|--|
| | $Eu = \left(1 - \frac{1.27 C_v}{\sqrt{n}} \right) \left(\frac{Q_m}{Q_a} \right)$ | Page # 36 | | | | | | | | | | | | | | | |
| where: | <table style="width: 100%; border: none;"> <tr> <td style="width: 10%;">Eu</td> <td style="width: 5%;">$=$</td> <td>Emission uniformity as a decimal</td> </tr> <tr> <td>n</td> <td>$=$</td> <td>Number of emitters per plant for point source emitters For line source emitters, the plant spacing divided by the orifice spacing or 1, whichever is greater.</td> </tr> <tr> <td>Q_m</td> <td>$=$</td> <td>Minimum emitter flow rate (gph) for the minimum pressure (H_m)</td> </tr> <tr> <td>Q_a</td> <td>$=$</td> <td>The average emitter flow rate (gph) for the average pressure (H_a)</td> </tr> <tr> <td>C_v</td> <td>$=$</td> <td>Manufacturer's coefficient of variation for the emitter type. (Usually provided by the manufacturer)</td> </tr> </table> | Eu | $=$ | Emission uniformity as a decimal | n | $=$ | Number of emitters per plant for point source emitters For line source emitters, the plant spacing divided by the orifice spacing or 1, whichever is greater. | Q_m | $=$ | Minimum emitter flow rate (gph) for the minimum pressure (H_m) | Q_a | $=$ | The average emitter flow rate (gph) for the average pressure (H_a) | C_v | $=$ | Manufacturer's coefficient of variation for the emitter type. (Usually provided by the manufacturer) | |
| Eu | $=$ | Emission uniformity as a decimal | | | | | | | | | | | | | | | |
| n | $=$ | Number of emitters per plant for point source emitters For line source emitters, the plant spacing divided by the orifice spacing or 1, whichever is greater. | | | | | | | | | | | | | | | |
| Q_m | $=$ | Minimum emitter flow rate (gph) for the minimum pressure (H_m) | | | | | | | | | | | | | | | |
| Q_a | $=$ | The average emitter flow rate (gph) for the average pressure (H_a) | | | | | | | | | | | | | | | |
| C_v | $=$ | Manufacturer's coefficient of variation for the emitter type. (Usually provided by the manufacturer) | | | | | | | | | | | | | | | |
| | <p>The first term bracketed in the formula expresses emitter flow rate variance due to a manufacturing variation (C_v). It is a measure of the tolerance to which the emitter is manufactured. Table 4.5 indicates a classification of C_v for a new emitter. The formula used to calculate C_v is as follows:</p> | | | | | | | | | | | | | | | | |
| | $C_v = \frac{\text{standard deviation} \times 100}{\text{mean}}$ | | | | | | | | | | | | | | | | |

Equation 4.4 Emission Uniformity Using Pressure

Page # 39

$$Eu = \left(1 - 1.27 \frac{Cv}{\sqrt{n}}\right) \left(\frac{Pm}{Pa}\right)^x$$

This can be rewritten for pressure variation as:

$$\left(\frac{Pm}{Pa}\right) = \left(\frac{Eu}{1 - 1.27 \frac{Cv}{\sqrt{n}}}\right)^{\frac{1}{x}}$$

The pressure variance (P_m/P_a) is described as the minimum pressure (P_m) divided by the average pressure (P_a). The actual operating pressure range P_{max} to P_{min} will be larger than the pressure variance term used in the Eu formula. P_{max} to P_{min} would normally be computed as two times the difference between P_{ave} and P_{min} . However, because the friction loss is not constant along a lateral and Eu is not calculated using absolute minimum values the allowable pressure variation can be slightly higher than a factor of 2 times the difference between P_{ave} and P_{min} . Equation 4.5 is used to calculate the allowable pressure difference.

Equation 4.5 Allowable Pressure Variation

Page # 39

$$\text{Allowable Pressure Difference} = 2.5 \times (P_{ave} - P_{min})$$

Equation 4.6 Emission Uniformity – Manufacturer's Coefficient

Page # 40

$$Eu_{cv} = 1 - 1.27 \frac{Cv}{\sqrt{n}}$$

Equation 4.7 Distribution Uniformity

$$Du = \frac{\text{“minimum” water applied to the plants} \times 100}{\text{average water applied to plants}}$$

Page # 42

Equation 4.8 Lower Quarter Distribution Uniformity

$$LQDU = \frac{\text{Lower Quarter} \times 100}{\text{Average}}$$

Page # 45

where:

| | | |
|---------------|---|---|
| LQDU | = | Lower Quarter Distribution Uniformity |
| Lower Quarter | = | Average of the lower 25% of the sample size |
| Average | = | Average of the total sample |

General criteria for the LQDU are:

| | | |
|-----------|---|-----------|
| > 90% | – | excellent |
| 80 - 90 % | – | good |
| 70 - 80 % | – | fair |
| < 70% | – | poor |

Equation 8.1 Total Dynamic Head

Page # 124

$$H_T = H_s + H_e + H_f + H_p$$

where:

H_s = Static suction head (vertical distance from the water level to the centre of the pump impellor)

H_e = Static discharge head (elevation difference from the centre of the impellor to the highest point of the irrigation system)

H_f = Friction head (total friction loss of all suction and mainline fittings between the pump and the zone pressure control valve)

H_p = Pressure head (the pressure required at the zone pressure control valve)

Equation 8.2 Horsepower

Page # 124

$$H.P. = \frac{Q \times H_T}{3960 \times E}$$

where:

Q = Trickle irrigation system flow rate (gpm)

H_T = Total dynamic head (ft)

E = Pump efficiency at the flow rate and total dynamic head required given as a decimal.

Equation 10.1 Mean Filter Capability – Drip Emitters

For drip emitters:

Page # 152

$$\text{MFC}_d = \frac{\text{Emitter Orifice Diameter}}{10}$$

Equation 10.2 Mean Filter Capability – Spray Emitters

For spray emitters:

Page # 152

$$\text{MFC}_s = \frac{\text{Emitter Orifice Diameter}}{7}$$

Equation 10.3 Screen Open Area

$$\text{Screen Open Area (ft}^2\text{)} \times 225 = \text{filter capacity in gpm}$$

Page # 161

Equation 10.4 Screen Surface Area

$$\text{SA} = \frac{\text{Q(gpm)}}{448 \times \text{V(ft/sec)} \times \%O_p}$$

Page # 161

where:

- SA = Screen surface area (ft²)
- Q = System flow velocity in gpm
- V = Flow velocity through the screen (ft/sec)
- %O_p = Open Area of the Screen Mesh (% shown as a decimal)

Equation 11.1 Saturation Index

$$\text{Saturation index} = \text{pH} - \text{pHc}$$

Page # 181

where:

$$\begin{aligned} \text{pH} &= \text{Actual measurement taken from water supply} \\ \text{pHc} &= \text{p(Ca + Mg + Na + K) + p(Ca + Mg) + p(CO}_3 + \text{HCO}_3) \\ &\quad \text{(Table 11.3)} \end{aligned}$$

To determine the saturation index a water sample should be analyzed for Ca, Mg, K, Na, HCO₃, CO₃ and pH. All units except for pH must be expressed in meq/L (milliequivalents per litre). Table 11.2 can be used to convert mg/L into meq/L. The pHc terms can be determined from Table 11.3.

Equation 11.2 Chlorination – Iron Treatment

$$\text{Cl}_g = \frac{\text{Fe} \times \text{Q}}{3.15}$$

Page # 186

where:

$$\begin{aligned} \text{Cl}_g &= \text{The amount of chlorine to add in g / hr} \\ \text{Fe}_{\text{mg/L}} &= \text{The concentration of Fe in the water supply in mg/L} \\ \text{Q} &= \text{The irrigation system flow rate in gpm} \end{aligned}$$

Equation 11.3 Chlorine Injection Rate – Organic Solid Control

$$\text{I} = \frac{\text{Q} \times \text{Cl}}{1,000,000} \times 60 \times \frac{100}{(\text{bleach \%})}$$

Page # 190

where:

$$\begin{aligned} \text{I} &= \text{Chlorine injection rate (gph)} \\ \text{Q} &= \text{Trickle system flow rate (gpm)} \\ \text{Cl} &= \text{Desired residual chlorine concentration in the water supply (mg/L) or ppm} \\ \text{Bleach \%} &= \text{Chlorine concentration of solution to be injected (\% of available chlorine)} \end{aligned}$$

Equation 11.4 Chlorine Injection Rate – Metric

| | | | |
|--|----------|---|--|
| | | | Page # 192 |
| | I | = | $Q \times \frac{Cl}{278} \times \frac{100}{(\% \text{ bleach})}$ |
| | I | = | Chlorine injection rate (Lph) |
| | Q | = | Trickle system flow rate (Litres per second) |
| | Cl | = | Desired chlorine concentration in the water supply (mg/L) or (ppm) |
| | Bleach % | = | Chlorine concentration of solution to be injected (% available chlorine) |

Equation 11.5 Chlorine Gas Injection Rate

| | | | |
|--|----------|---|--|
| | | | Page # 192 |
| | I | = | $Q \times Cl$ |
| | I | = | Chlorine gas injection rate (lbs / hr) |
| | Q | = | Trickle system flow rate (gpm) |
| | Cl | = | Desired chlorine concentration in the water supply (mg/L) or (ppm) |

Equation 11.6 Acid Injection Rate

| | | | |
|--|----------------------|---|---|
| | | | Page # 196 |
| | I_a | = | $\frac{A \times Q \times 60}{1000}$ |
| | where: | | |
| | I _a | = | Acid injection rate L/hr |
| | A | = | Amount of acid (litres) / 1000 gallons of water (Table 11.5 if acid factor known) |
| | Q | = | Trickle irrigation system flow rate (gpm) |

Equation 11.7 Sulphuric Acid Injection Rate

$$L_{\text{H}_2\text{SO}_4} = \frac{\text{HCO}_3 \text{ meq/L} \times Q}{287}$$

Page # 197

where:

$L_{\text{H}_2\text{SO}_4}$ = Litres of sulfuric acid per hour

$\text{HCO}_3 \text{ meq/L}$ = Amount of HCO_3 in the water supply in meq/L

Q = The irrigation zone flow rate in gpm

Equation 12.1 Sodium Adsorption Ratio

$$\text{SAR} = \sqrt{\frac{Na}{Ca + Mg}}$$

Page # 204

where:

SAR = Sodium Adsorption Ratio

Na = Na ion in meq/L

Ca = Ca ion in meq/L

Mg = Mg ion in meq/L

Equation 14.1 Fertilizer Injection Rate

$$I_c = \frac{Q_c \times A}{C \times T}$$

Page # 242

where:

I_c = Rate of chemical injection (L/min)

Q_c = Quantity of chemical to be applied per irrigation cycle (kg/ha)

C = Concentration of injected solution (kg/L)

A = Area (ha)

T = Total time of injection (min)

Equation 15.1 Landscape Plant Water Requirement

| | | | | |
|--------|-----------------|---|--|-------------------|
| | G/P/D | = | 0.623 x A x K_s x ET_o E x CE | Page # 248 |
| where: | 0.623 | = | 27,152 gal/ac-in (conversion factor) 43,560 ft ² /acre | |
| | A | = | Plant root zone area (ft ²) | |
| | K _s | = | Crop species factor (Table 15.2) | |
| | ET _o | = | Reference evapotranspiration rate for location (in/day) (Table 2.1) | |
| | E | = | Application efficiency (Table 3.8) | |
| | CE | = | Climate Efficiency (Table 15.1) | |

Equation 15.2 Evapotranspiration for Landscape Plants

| | | | | |
|--------|------------|---|---------------------------------------|-------------------|
| | ETL | = | KL x ETo (in/day) | Page # 252 |
| where: | ETL | = | Evapotranspiration landscape (in/day) | |
| | KL | = | Landscape coefficient | |
| | ETo | = | Reference evapotranspiration (in/day) | |

Equation 15.3 Landscape Crop Coefficient

| | | | | |
|--|----------------------|---|---|-------------------|
| | K_L | = | K_s x K_d x K_{mc} | Page # 254 |
| Where: | K _L | = | Landscape Coefficient | |
| | K _s | = | Species factor (Table 15.2) | |
| | K _d | = | Density factor (Table 15.3) | |
| | K _{mc} | = | Microclimate factor (Table 15.4) | |
| <p>The landscape coefficient (K_L) is approximated for a known period of time (annual average, monthly, daily or stage of growth). Once determined it is then applied to the reference evapotranspiration (ET_o) to establish the landscape evapotranspiration rate used to calculate plant water requirements using the landscape coefficient method.</p> | | | | |

Equation 15.4 Number of Emitters Per Plant

Page # 256

$$\text{Number of Emitters} = \frac{\text{Plant root zone area} \times 0.50}{\text{Area wetted by one Emitter}}$$

Equation 15.5 Application Rate for Drip Systems

Page # 260

$$\text{AR} = \frac{1.6 \times Q}{A}$$

where:

| | | |
|----|---|---|
| AR | = | Application Rate of the drip system (in/hr) |
| Q | = | Flow Rate supplied by the drip system (gph) |
| A | = | Area to be irrigated (ft ²) |

Equation 15.6 Maximum Irrigation Interval for Landscape Systems

Page # 265

$$\text{Maximum Irrigation Interval} = \frac{\text{Maximum Operating Time}}{\text{Calculated Operating Time per Day}}$$
