Spongy Moths (formerly gypsy moth) are **invasive pests that have been found in your area.**

To protect British Columbia's forests, farms, parks and neighbourhood trees from this invasive pest, the Ministries of Forests and Agriculture and Food have developed a plan to safely treat residential and municipal areas. Please join us to learn more about British Columbia's treatment plan.

HOW: In person at Beach Grove Elementary (library), 5955 17A Ave, Delta, BC, V4L 1J7

WHEN: Wednesday, February 18, 2026, 5:30 p.m. to 8 p.m.

WHO: The B.C. Spongy Moth Technical Advisory Committee (Ministry of Forests, Ministry of Water, Land and Resource Stewardship, Ministry of Agriculture and Food, Canadian Food Inspection Agency, Canadian Forest Service, Invasive Species Council of B.C.) and other experts.

THE PROVINCE PLANS TO TREAT THE AREA WITH A BIOLOGICAL INSECTICIDE.

The 2025 spongy moth trapping data indicates that spongy moths continue to establish in Delta. An adjacent area was sprayed in 2024 however a small subset of the establishing population was not successfully eradicated. Aerial spraying is planned for spring 2026 to eliminate the population and prevent further spread.

Aircraft will be used to apply a biological insecticide, Foray 48B. The active ingredient is *Bacillus thuringiensis var kurstaki* (Btk), which occurs naturally in soil and is commonly used in organic agriculture. This treatment is effective at eradicating spongy moths. It impacts only moth and butterfly caterpillars that eat sprayed leaves. Repeat scientific study concludes the proposed treatment has no known toxic effects for people. Btk does not impact livestock, pets, birds, fish, spiders, bees, ladybugs, or amphibians.

Specialists will provide program information and answer questions about the 2025 trapping season and the 2026 treatment areas during the open house.
