Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	History		
Attribute:	**Activity_CD**		
Alias:	**Activity_CD**		

Forestry Term:	History Activity Code
Description:	A code describing the historical activity (e.g. Wildfire, Juvenile Spacing, Fertilization, etc.) that occurred in the specified layer of the stand.
Content:	2 position 1 character alpha code designating the history or silviculture activity
Default:	Must have value

Permitted Values:
A - Animal damage (general)   DI
B - Wildlife   DI
BE - Escaped burn (DI)
BG - Ground fire (DI)
BR - Range burn (DI)
BW - Wildlife burn (DI)
D - Diseases (general) (DI)
F - Flooding (DI)
I - Insects (general) (DI)
K - Fume Kill (DI)
L - Logging (DI)
L - Logging (partial disturbance) (DI)
N - Non-Biological (abiotic) injuries (DI)
R - Site rehabilitation (DI)
S - Slide or Avalanche (DI)
T - Treatment injuries (general) (DI)
U - Damage (cause unknown) (DI)
V - Problem vegetation (DI)
W - Windthrow (DI)
B - Broadcast burn (SI)
C - Chemical (SI)
G - Grass Seeded (SI)
H - Hand preparation (SI)
M - Mechanical scarification (SI)
MS - Mechanical scarification & spot burn (SI)
RB - Range management burn (SI)
S - Spot burn (SI)
W - Windthrow (SI)
F - Fertilization (ST)
H - Hack and Squirt (ST)
J - Juvenile spacing (ST)
M - Mistletoe control (ST)
P - Pruning (ST)
R - Conifer release (ST)
S - Sanitation spacing (ST)
T - Commercial Thinning (ST)
W - Brushing and Weeding (ST)

Use:	Used in conjunction with the History Attribute Code to uniquely describe the historical events that have occurred in a specified layer of the stand. This historical information is used to provide summaries of causes of disturbance and silviculutral activities. When undertaking summaries, care should be taken to check all layers. Components of the Activity code are placed on a labelled map.
Linkage:	Activity_sub_cd, Attribute_cd

Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	History		

Attribute: **Activity_Sub_Cd**

Alias: **Insect_Disease_Cd**

Forestry Term: Insect or Disease Distur

Description: A code indicating the type of insect or disease that has caused a disturbance in the stand's history. Stands with a disturbance caused by insects or disease can be further described by the type of insect or disease.

Content: 2 character alpha code indicating species of insect or type of disease responsible for disturbance.

Default: Blank

Permitted Values: Animal Damage (general)
 B - Bear
 C - Cattle
 D - Deer
 E - Elk
 H - Hare or Rabbit
 M - Moose
 P - Porcupine
 S - Squirrel
 V - Vole
 X - Birds
 Z - Beaver

Diseases (general)
 1 - Dwarf Mistletoes
 2 - Roots Rots
 3 - Foliage Diseases
 4 - Rusts
 01 - Dwarf Mistletoes
 02 - Roots Rots
 03 - Foliage Diseases
 04 - Rusts
 A - Foliages Diseases (general)
 AF - Broom Rusts
 B - Brooming (Non-Mistletoe)
 BF - Fir Broom Rust
 BS - Spruce Broom Rust
 D - Stem Rots (general)
 DA - Armillaria
 DC - Laminated, Cedar Strain Only
 DE - Rust-Red Stringy Rot
 DF - Brown Crumbly Rot
 DI - Tomentosus
 DL - Laminated (not cedar strain)
 DN - Annosus
 DP - Red Ring Rot
 DS - Schweinitzii Butt Rot
 DT - Aspen Trunk Rot
 F - Foiage Diseases (general)
 FB - Larce Needle Blight
 FD - Douglas-fir Needle Cast
 FE - Elytroderma Needle Cast
 FL - Lophodermelia (Pine) Needle Cast
 FM - Larch Needle Cast
 FP - Fir Needle Blight (Fir-fireweed Rust)
 FR - Red Band Needle (Blight) Cast
 L - Leader and Branch Dieback (general)
 LD - Derma Canker

LL - Leader Dieback
LP - Phomopsis Canker
LR - Branch Dieback
LS - Sydowia (Sclerophoma) Tip Dieback
LV - Aspen-poplar Twig Blight
M - Dwarf Mistletos (general)
MF - Douglas-fir Dwarf Mistletoe
MH - Hemlock Dwarf Mistletoe
ML - Larch Dwarf Mistletoe
MP - Lodgepole Pine Dwarf Mistletoe
P - Bark Disease (general)
R - Root Disease (general)
RA - Amarillaria Root Disease
RB - Black Stain Root Disease
RC - Laminated Root Rot, Cedar Strain
RL - Laminated Root Rot, not Cedar Strain
RN - Annosus Root Rot
RR - Rhizina Root Disease
RT - Tomentosus Root Rot
S - Stem Diseases (general)
SA - Atropellis Canker (Lodgepole Pine)
SB - White Pine Blister Rust
SC - Comandra Blister Rust
SG - Western Gall Rust
SN - Aspen Cankers (Cystopora Canker)
SN - Aspen Cankers (Hypoxlon Canker)
SN - Aspen Cankers (Cryptospheria Canker)
SN - Aspen Cankers (Target Canker)
SN - Aspen Cankers (Ceratocystis Canker)
SN - Aspen Cankers (Sooty Bark Canker Canker)
SS - Stalactiform Blister Rust
SX - Exploding Canker of Douglas-fir and Interior Spruces

Insects (general)
 1 - Western Blackheaded Budworm
 2 - Black Army Cutworm
 3 - Douglas-fir Tussock Moth
 4 - Forest Tent Caterpillar
 5 - Gypsy Moth
 6 - Greenstriped Forest Looper
 7 - Larch Casebearer
 8 - Larch Sawfly
 9 - Western False Hemlock Looper
01 - Western Blackheaded Budworm
02 - Black Army Cutworm
03 - Douglas-fir Tussock Moth
04 - Forest Tent Caterpillar
05 - Gypsy Moth
06 - Greenstriped Forest Looper
07 - Larch Casebearer
08 - Larch Sawfly
09 - Western False Hemlock Looper
10 - Western Hemlock Looper
11 - Western Spruce Budworm
12 - Douglas-Fir Beetle
13 - Mountain Pine Beetle
14 - Spruce Beetle
15 - Balsam Wooly Aphid
16 - Cooley Spruce Gall Adelgid
17 - White Pine Weevil
A - Aphids (general)
AB - Balsam Wooly Adelgid
AC - Gian Conifer Aphid
AG - Colley Spruce Gall Adelgid
AS - Green Spruce Aphid
B - Bark Beetles (general)
BB - Western Balsam Bark Beetle
BD - Douglas-fir Beetle
BI - Engraver Beetle
BM - Mountain Pine Beetle

BP - Twig Beetle and Others
BS - Spruce Beetle
BT - Red Turpentine Beetle
BW - Western Pine Beetle
D - Defoliatiors (general)
DA - Black Army Cutworm
DC - Larch Casebearer
DD - Loper (Deciduous)
DE - Eastern Spruce Budworm
DF - Forest Tent Caterpillar
DG - Greenstriped Forest Looper
DH - Western Blackheaded Budworm
DM - Gypsy Moth
DN - Birch Leaf Miner
DP - Larch Sawfly
DR - Red Alder Sawfly
DS - Conifer Sawfly
DT - Douglas-fir Tussock Moth
DU - Satin Moth
DV - Variegated Cutworm
DW - Western Aspen Tortrix
DZ - Western False Hemlock Looper
M - Mite Damage (general)
S - Shoot Insects (general)
SB - Western Cedar Borer
SE - European Pine Shoot Moth
SG - Gouty Pitch Midge
SP - Pitch Nodule Moths
SQ - Sequoia Pitch Moth
SS - Western Pine Shoot Borer
W - Weevils (general)
WC - Steremnius Root Collar Weevil
WM - Magdalis Species
WP - Lodgepole Pine Terminal Weevil
WS - White Pine (Spruce) Weevil
WW - Warren's Root Collar Weevil
WY - Cylindrocopturus Weevil
WZ - Yosemit Bark Weevil

Non-Biological (abiotic) Injuries
B - Wildfire
D - Drought
F - Flooding
G - Frost (general)
GC - Frost Crack
GH - Frost Heaved
GK - Shoot/Bud Frost Kill
Hv - Hail
K - Fume Kill
L - Lightning
N - Road Salt
R - Redbelt
S - Slide
W - Windthrow
WS - Windthrow-soil failure
WT - Windthrow-treatment or harvest related
X - Scarring/rubbing
Y - Snow or Ice (including Snow Press)
Z - Sunscald

treatment Injuries (general)
C - Chemical
L - Logging
M - Mechanical
P - Planting
PM - Poor Planting Microsite
R - Pruning
T - Thinning or Spacing

Damage (cause Unknown)

A - Atypical Growth
B - Breakage (Dead or Broken Top)
C - Crown Symptoms (Chlorotic)
F - Fluted Butt
G - Gails
K - Fork or Pronounced Crook
L - Leaning
M - Multiple Leaders
R - Brooming
S - Basal Sweep

Problem Vegetation
H - Herbaceous Competition
P - Vegetation Press
S - Shrub Competition
T - Tree Competition

Use:	Used in combination with attribute code and activity code to define the causative factor and extent of disturbance due to specific insects and diseases.
Linkage:	Activity_cd

Subject Area:	FIP			
Entity Type:	Forest_Inventory_Planning			
Subtype:	Layer			
Attribute:	**Age_Class_Cd**			
Alias:	**Age_Class_Cd**			

Forestry Term: Age Class at Reference

Description: A code indicating the age class of the stand at the reference year. Age classes are intervals, or ranges, of ages into which trees, forests, stands, or forest types are divided into for classification and use.

Content: 1 character numeric code between indicating age class

Default: Must have value

Permitted Values:
0 Stand age 0
1 Stand age 1 to 20 years
2 Stand age 21 to 40 years
3 Stand age 41 to 60 years
4 Stand age 61 to 80 years
5 Stand age 81 to 100 years
6 Stand age 101 to 120 years
7 Stand age 121 to 140 years
8 Stand age 141 to 250 years
9 Stand age 251 + years

Use: Used with Projected Age Class to summarize age class movements following projection.

Linkage: May be calculated from Stand_Age; may be used to calculate Stand_Age (CC records). May be used to determine maturity in forest stands, i.e. Typid 1 and 2.

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Resultant

Attribute: **Agricultural_land_Reserve_Cd**

Alias: **Agricultural_Land_Reserve**

Forestry Term: Agricultural Land Reserv

Description: The Agricultural Land Reserve designation (s) that fall within the forest cover polygon. Agricultural Land
                    Reserves (ALR) are areas designated as having a high agricultural value. An ALR designation does not preclude
                    the management of the land for forest production. These Reserves are defined under Sections 1 and 8 of the
                    Agricultural Land Commission Act.

Content: 2 character numeric code indicating presence of ALR

Default: 01 Unreported

Permitted Values: 00 No Agricultural Land Reserve (No A.L.R.)
                    01 Unreported (out of Province)
                    88 Agricultural Land Reserve (A.L.R.)

Use: Used to indicate the area of the polygon located within a Agricultural Land Reserve. Used to identify land with a
                    high agricultural value.

Linkage: None

Format: Record Type: Resultant

Model: FIP Database   VRI Data Model   ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: History

Attribute: **Attribute_cd**

Alias: **Attribute_cd**

Forestry Term: History Attribute Codes

Description: A code describing the type of stand history described in this record. History types include the presence of some
                        type of Disturbance, and broad based silvicultural activities such as site preparation, stand tending, and
                        plantation.

Content: 2 character alpha code designating history Attribute

Default: Blank

Permitted Values: <blank>
                        DI - Disturbance
                        SI - Site Preparation
                        ST - Stand tending
                        PL - Plantation

Use: Used in conjunction with the History Activity Code and History Activity Sub Code to describe the type of activity
                        (e.g. fire, logging) which has taken place in a particular stand. This historical information is used to provide
                        summaries of causes of disturbances and silvicultural activities. When undertaking summaries, care should be
                        taken to check all layers in the stand.

Linkage: Activity_cd, Activity_sub_cd

Format: Record type: History
                        Field: 6
                        Type: Character

Attribute: **Compartment**

Alias: **Compartment**

Forestry Term: Inventory Compartment

Description: The inventory compartment (s) that fall within the forest cover polygon. Inventory compartments are a geographic subdivision of an inventory region, usually defining a watershed or part thereof. Inventory compartment is also part of the reference key for identifying the geographic location of all inventory branch samples. Inventory compartment, along with compartment letter and inventory region form the key to identifying inventory samples.

Content: A 3 digit numeric code between 1 and 206 with 999 being used for areas outside the Province.

Default: 999 designates areas outside of the Province

Permitted Values: 1 to 206   999 defines areas outside the Province.

Use: Used to indicate the area of the polygon that is located within an inventory compartment. Used in conjunction with inventory region to assign Fiz zones. Also used for defining area boundaries for area and volume summaries.

Linkage: Used with Inventory_Region to derive Fiz_code.

Format: Record type: Resultant
                         Field: 14
                         Type: Numeric
                         Width: 3

Model: FIP Database   VRI Data Model   ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Crown_Closure_Class**

Alias: **Crown_Closure_Class**

Forestry Term: Crown_Closure_Class

Description: A code indicating the crown closure class of the stand. Crown closure classes are intervals, or ranges, of crown closures into which stands or forest types are divided into for classification and use.

Content: 2 character numeric code designating crown closure class

Default: 0

Permitted Values: 0   0 - 5 % crown closure
                    1   6 - 15 % crown closure
                    2   16 - 25 % crown closure
                    3   26 - 35 % crown closure
                    4   36 - 45 % crown closure
                    5   46 - 55 % crown closure
                    6   56 - 65 % crown closure
                    7   66 - 75 % crown closure
                    8   76 - 85 % crown closure
                    9   86 - 95 % crown closure
                    10 96 - 100 % crown closure

Use: Used in the application of Growth Models to adjust volume based stand density. Also used for the estimation of understory productivity.

Linkage: Calculated using crown_closure_air. Used as an index to a table lookup for stocking_class_cd.

Format: Record Type: Layer
                    Field Name:

Model:	FIP Database	VRI Data Model	☑
Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	Layer		
Attribute:	**Data_Srce_Class_Cd**		
Alias:	**Data_Srce_Class_Cd**		

Forestry Term: Data Source Class Code

Description: A layer identifying the method of data collection for this layer (e.g. Air Photo Interpretation, Air Calls, Valuation Cruise Plot, etc.)

Content: 2 character numeric code designating method of data

Default: Must have value

Permitted Values:
0 - Photo interpretation
1 - Air call (air observation without 70 mm photography)
2 - Classification from low-level fixed base, 70mm photography
3 - Phase 1 photo sample
4 - Ground call, 1 points
5 - Standard fixed-radius sample (pre 1979), productivity sample
6 - Phase 2 or phase 3 sample
7 - Silvicultural Surveys - stocking, survival, free-growing, pre-stand tending.
8 - Ground observation with measurement
9 - Research plot (s)
10 - Silviculutre treatment record - a record that summarizes the modified stand structure following an activity or treatment such as planting, juvenile spacing, brushing and weeding, conifer release, seed tree control, sanitation spacing, rehabilitation or commercial thinning.

12 - Disturbance - an area recently disturbed by fire, logging, wind throw or insects, that is classified as NSR, and that has no source of information, other than the type and year of the disturbance.

13 - Managed stand sample
14 - Ground call, 2 or more points
15 - Ground traversed boundary requiring photo confirmation
71 - Silviculture Surveys - Free Growing
72 - Silviculture Surveys - Conditional Free Growing
73 - Silviculture Surveys - Not Free Growing
74 - Silviculture Surveys - Pre-Stand Tending

Use: Identifies the sampling methods used to collect the layer information. The sampling method used, impacts the accuracy (e.g. confidence interval) and hence the reliability of the data.

Linkage: Linked to all stand attributes

Format: Record Type: Layer

Alias: **Data_Srce_Orign_Cd**

Forestry Term: Data Source Origin

Description: A code describing the source of the polygon attributes and label, including species, age, and height. For example, the data source may be from an adjacent polygon with a similar stand history, or from an artificial type boundary such as a road or power line.

Content: 1 character numeric code indicating the data source

Default: Must have value

Permitted Values: 0 - No qualification necessary (data source occurs within forest cover type)
1 - Artificial type boundary; neat line, double-line power line, road, etc, administration boundary

2 - Adjacent but disconnected forest cover type with a similar history of stand development

3 - Adjacent type islands sharing a common boundary with a similar history of common stand development

4 - Data source was destroyed by a disturbance both still applies to the undisturbed portion of the original type.

Use: Implies reliability of the polygon label.

Linkage: None

Format: Record Type: Layer
Field Name:
Field: 9
Type: Numeric
Width: 1
Dec:
Position: 24: 24

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Dbh_limit_cd**

Alias: **Minimum_dbh**

Forestry Term: Dbh_limit

Description: A code indicating the minimum diameter breast height (dbh) for measuring trees (i.e. stems) in the field sample.
                      For example, a code 3 indicates that stems were measured if they have a dbh greater than or equal to 7.5 cm.

Content: 1 character numeric code reflecting the minimum diameter

Default: 0

Permitted Values: 1 - less than or equal to 0.0 cm diameter breast height
                      2 - Greater than or equal to 0.0 cm diameter breast height but less than 7.5 cm dbh
                      3 - All stems greater than or equal to 7.5 cm diameter breast height
                      4 - All stems greater than or equal to 12.5 cm diameter breast height
                      5 - All stems greater than or equal to 17.5 cm diameter breast height
                      6 - All stems greater than or equal to 22.5 cm diameter breast height
                      7 - All stems greater than or equal to 27.5 cm diameter breast height

Use: Indicates diameter limits used in the sample established within the stand

Linkage: None.

Model: FIP Database VRI Data Model ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **For_Cover_Layer_Cd**

Alias: **For_Cover_Layer_Cd**

Forestry Term: Stand Layer

Description: A code that uniquely identifies each layer, or horizontal stratum, in a stand. Each layer is normally characterized as a distinct canopy containing a common forest cover structure with timber of similar ages and heights. Layers are assigned from the tallest layer downward. Veteran or Silviculture layers are the exception, and are assigned a separate layer code. In order for a stand to be classified as multi-layered, there must be two or more distinct canopies. Stands without distinctly different canopies are classified as having a single layer, this can include all aged stands.

Content: 1 character alpha code designating layer

Default: Must have value

Permitted Values: 1 Layer 1
2 Layer 2
3 Layer 3
S Silviculture
V Veteran

Use: Use layer code is used to identify the position and type of layers comprising a stand.

Linkage: The rank assigned to the layer indicates its importance.

Format: Record type: Layer

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **For_Cover_Rank_Cd**

Alias: **For_Cover_Rank_Cd**

Forestry Term: Rank or Importance of L

Description: A code indicating the importance of each layer in the stand. Each layer in a multi-layered stand is assigned a
                        rank code indicating the relative importance of that layer. The layer assigned Rank 1 in multi-layer stands is the
                        most important layer. Volumes are calculated for Rank 1 stands only. Rank assignment is based on Regional
                        guidelines.

Content: 1 character numeric value indicating the importance of the layer

Default: Blank

Permitted Values: 1 Rank 1, most important layer
                        2 Rank 2, second most important layer
                        3 Rank 3, third most important layer

Use: Defines the importance of the layer. Only Rank 1 layers are used when summarizing the land base for Timber
                        Supply Analyses

Linkage: Allowable Layer values are rank related; Volumes are only calculated for Rank 1 stands.

Format: Record type: Layer
                        Field: 4
                        Type: Character

Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	Resultant		
Attribute:	**Grid_No**		
Alias:	**Grid_No**		

Forestry Term:	UTM Grid Number
Description:	The numeric code of the UTM Grid or grids that lies within the forest cover polygon. UTM Grids are 2000m by 2000m square grids found on the mapsheet. The Grid Number is defined by the first 3 numbers of the easting, and first 4 numbers on the northing of the south west corner of the grid. Grid origin is on even 2000 metre UTM positions. For example, a value of 5266048 implies that the easting has a value of 526 and a northing of 6048
Content:	7 character numeric code designating UTM grid position
Default:	Must have value
Permitted Values:	5265048
Use:	Used to indicate the area of the polygon that is located within a UTM Grid. The UTM Grids allow the user to define areas of interest where a "low resolution" boundary is acceptable for area, volume, and other summaries.
Linkage:	None

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Height_Class_Cd**

Alias: **Height_Class_Cd**

Forestry Term: Height Class at Referen

Description: A code indicating the height class of the stand at the reference year. Height classes represent intervals into which the range of tree or stand heights are subdivided for classification and use.

Content: 1 character numeric value between 0 to 8 indicating height

Default: Must have value

Permitted Values:
0.0 m
1 0.1 - 10.4 m
2 10.5 - 19.4 m
3 19.5 - 28.4 m
4 28.5 - 37.4 m
5 37.5 - 46.4 m
6 46.5 - 55.4 m
7 55.5 - 64.4 m
8 64.5+ m

Use: Used to determine height class changes due to projection.

Linkage: May be calculated using Stand_Height; may be used to calculate Stand_height.

Format:

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Polygon

Attribute: **Inoperability_Ind**

Alias: **Inoperability_Cd**

Forestry Term: Inoperability Code

Description: A code defining areas (i.e. stands) containing merchantable timber that cannot be harvested economically using current technology. For example, stands may not be harvestable because of some physical barrier such as a hanging valley, or because an area contains small patches of overmature timber surrounded by large areas of young stands. Inoperability was originally an ESA designation, but is now a separate attribute referring specifically to the harvesting economics of the stand. This code is distinctly different from the Operability Code found in the Resultant Record Type.

Content: 1 character alpha code holding inoperability code

Default: blank

Permitted Values: <blank> implied operable
I   Inoperable

Use: Used extensively in determining the contributing land base for timber supply analyses

Linkage: None

Format: Record type: Polygon
Field: 16

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Resultant

Attribute: **Inventory_Region**

Alias: **Inventory_Region**

Forestry Term: Inventory Region

Description: The Inventory Region (s) that fall within the forest cover polygon. Inventory Regions are an administrative and planning level boundary used to subdivide the Province into 88 units. Inventory Region is also part of the reference key for identifying the geographic location of all inventory branch samples. Inventory region, along with inventory compartment and compartment letter, form the key to identifying the inventory samples.

Content: 2 character numeric code between 1 and 88 with 99 benign used for areas outside the Province.

Default: 99

Permitted Values: 1 to 88 Valid Inventory Regions
                    99 Areas outside the Province

Use: Used to indicate the area of the polygon that is located within an inventory region. Used in conjunction with inventory compartment to assign FIZ zones. Also used for defining area boundaries for area and volume summaries.

Linkage: Used with compartment to derive fiz_code

Format: Record type: Resultant
                    Field: 13

Use:
Inventory Type Group (ITG) is used extensively in: area, volume, and other summaries where it is not necessary to summarize data by individual species, and determining the Supply Analyses and Local Resource Use Plans (LRUPs). The inventory type group is also used to provide a reference species for determining site index for productive forest land currently without commercial forest cover. For example, NSR prescribed for planting with Douglas fir would be assigned an ITG code of 1.

Linkage:
Based on a table lookup using tree_species_cd_1 and optionally tree_species_cd_2 (if it is a major species). Used in the calculation of stocking_class_cd and as an index to volume calculation coefficients.

Description:	Identifies the version of the error checking (validation) software used for validating FIP attributes as an aid to change management for the database and related applications.

Specifically Position   Meaning
           58-59   Release number
           60   . (period)
           61-63   Release version
           61-62   numeric
           63   alpha

Content:	6 character alpha code designating version of error checking software.
Default:	must have value
Permitted Values:	2.01a
Use:	identifies version of error checking used during FIP file processing.
Linkage:	None
Format:	Record type: Version Field: 9 Type: Character Width: 6 Dec: Position: 58: 63
Related Attribute:	None

References:	Ministry of Forests, Resources Inventory Branch, Resource Inventory Section
Agency Responsible:	Ministry of Forests, Resource Inventory Branch

Model: FIP Database   VRI Data Model   ☑

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Version

Attribute: **Last_Fipupdate_Date**

Alias: **Last_Fipupdate_Date**

Forestry Term: Last Fipupdate Date

Description: The date the FIP file was last updated as part of the FIP completion process. More specifically, the date that the FIP file had the FIPUPDATE process (i.e. completion, projection, and volume processes) run against it.

Content: 8 character alpha code holding year, month and day.

Default: Must have value

Permitted Values: 1991231

Use: Indicates the date of completion of the FIP file.

Linkage: None

Format: Record type: Version
                   Field: 6
                   Type: Character
                   Width: 8

Model: FIP Database   VRI Data Model   ☑

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Polygon

Attribute: **Layer_Cnt**

Alias: **Layer_Cnt**

Forestry Term: Number of Layer Record

Description: The number of Layer records (each layer in the stand is described in a separate record) for the particular polygon being described.

Content: 1 character numeric value indicating the number of stand layers.

Default: Must have value

Permitted Values: 1 - 5 (3 layers + Silviculture + Veteran)

Use: Used to ensure that users accessing FIP file information process the correct number of layers in the stand.

Linkage: Links to Layer records.

Format: Record type: Polygon
                    Field: 20
                    Type: Numeric
                    Width: 1
                    Dec:

Model:	FIP Database	VRI Data Model	☑
Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	History, Layer, Polygon, Resultant, Ver		
Attribute:	**Mapsheet_id**		
Alias:	**Mapsheet_id**		

Forestry Term: Forest Cover map Numb

Description: Identifies the Forest Cover Map corresponding to the FIP file. It is the British Columbia Geographic System's (BCGS) Key Reference Number of the forest cover map. The mapsheet must commonly used is the 6' x 12' BCGS mapsheet.

Content: 8 character alpha code holding BCGS map number

Default: Must have a value

Permitted Values: The identifier in this case is eight long and is made up of:
Position 2-4 Mapsheet Grid
              NTS or BCGS. Values are 82, 83, 92, 93, 94, 102, 103, 104, 114

      5 Mapsheet Letter
       BCGS/NTS letter. Values are A - P, and W.

    6-8 Mapsheet Square
       BCGS Number or NTS Number and letter. BCGS number values are 1 -100, and
       nts number values are 1-16 with NTS letter values A-H, and W.

      9 Mapsheet Quad and identifier for 3' x 6 ' (1:10,000 scale) mapsheets.

E.g. 082G002 - 6' x 12' minute map sheet

Use: Identifies the mapsheet containing the corresponding Forest Cover Map.

Linkage: Appears on all records

Format: Record Type: History, Layer, Polygon, Resultant
Field Name:
Field: 2
Type: Character
Width: 8
Dec:
Position: 2: 9

Related Attribute: Record_type_cd

Model:	FIP Database	VRI Data Model	☑
Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	Layer		
Attribute:	**Non_Forest_Descriptor**		
Alias:	**Non_Forest_Descriptor**		

Forestry Term: Non-Forest Descriptor

Description: A classification code indicating that the forest cover type is not currently forested, but is capable of supporting commercial forests. The Non-Forest Descriptor is distinctly different from the Non-Productive Descriptor found in the Polygon Record. The Non-Forest Descriptor indicates that the forest cover polygon is potentially productive, but is not currently supporting commercial forests, whereas the Non-Productive Descriptor indicates that the stand is not capable of supporting commercial forests.

Content: 5 character alpha holding the abbreviation for Non-Forest

Default: blank

Permitted Values: NCBR Non-commercial brush
                     NC   Non-commercial
                     NSR   Not sufficiently restocked
                     NTA   No Typing available

Use: Used to define land that is not currently forested but is capable of supporting commercial forest. It is also used to determine potential areas for silviculture treatment and to determine the net land base for Timber Supply Analyses.

Linkage: Type_Identity_Ref and Projected_Type_Id may be determined by Non_Forest_Descriptor.

Format: Record type: Layer
                     Field: 6
                     Type: Character
                     Width: 5
                     Dec:
                     Position: 16: 20

Related Attribute: Type_Identity_Reference, Projected_Tye_Id, Tree_Species_Cd_1 to Tree_Species_Cd_6, Tree_Species_Pct_1 to Tree_Species_Pct_6

Agency Responsible: Ministry of Forests, Silviculture/Resources Inventory, District

Model:	FIP Database		VRI Data Model	☑
Subject Area:	FIP			
Entity Type:	Forest_Inventory_Planning			
Subtype:	Polygon			

Attribute: **Non_Productive_Cd**

Alias: **Basic_Class**

Forestry Term:	Basic Class
Description:	A unique numeric code that references the classes or type of non-productive areas.
Content:	2 Character numeric code designating non-productive type code
Default:	Zero

Permitted Values:

Non Productive Code	Non Productive Description	Description
=========	==========	=======================
01	Ice	Icefield
02	A	Alpine
03	R	Rock
06	GR	Gravel Pit
07	Sand	Sand
09	CL	Clay Bank
10	AF	Alpine Forest (with species etc.)
11	NPBR	Non-Productive Brush
12	NP	Non-Productive / Non Productive Forest
13	NPBU	Non-Productive Burn
15	L	Lake
16	Tide	Tidal Flat
18	G	Gravel Bar
25	Riv	River
26	Mud	Mud
35	S	Swamp (completed file)
42	C	Clearing
50	U	Roads
54	U	Urban
60	P	Hayfield
62	M	Meadow
63	OR	Open Range
64	NA	Non-Applicable (salt water)

Use:	used in summaries based on non-productive land types. Also used in the generation of colour theme maps.
Linkage:	Calculated based on Non_productive_Forest_Descriptor. Used to establish both Type_Identity_Reference and Projected _Type_ID
Format:	Record Type: Polygon Field Name: Field: 6 Type: Numeric Width: 2 Dec: Position: 29: 30
Related Attribute:	Non_Productive_Forest_Descriptor, Type_Identity_Reference, Projected_Type_Id

VRI Data Model ☑

Attribute:	**Non_Productive_Forest_Descriptor**
Alias:	**Non_Productive_Forest_Descriptor**

Forestry Term: Non-Productive Descript

Description: A classification code describing land, water or wetland that is incapable of supporting commercial forests. A Non-Productive descriptor does not imply that the land is unproductive for other valuable resources, such as wildlife, fisheries, recreation, etc. The Non-Productive classification is one of the major classes in the Forest Classification System.

Content: 5 character alpha code holding the abbreviation of the non-productive descriptor

Default: Blank

Permitted Values:
NTA - No Typing Available
Ice - Icefield
A - Alpine
R - Rock
GR - Gravel Pit
Sand - Sand
CL - Clay Bank
AF - Alpine Forest (with Species etc.)
NPBR - Non-Productive Brush
NP - Non-Productive
NP - Non-Productive Forest (with species etc.)
NPBU - Non-Productive Burn
L - Lake
TIDE - Tidal Flat
G - Gravel Bar
RIV - River
MUD - Mud Flat
S - Swamp (muskeg)
C - Clearing
U - Roads
U - Urban
P - Hayfield
M - Meadow
OR - Open Range
NA - Non-Applicable (salt water)

Use: Used to provide area summaries and statistics for various classes of non-productive areas.

Linkage: Non_Productive_Cd is determined based on this field.

Format:
Record type: Polygon
Field: 5
Type: Character
Width: 5
Dec:
Position: 24: 28

Related Attribute: Non_Productive_Cd, Type_Identity_Reference, Projected_Type_Id

Model:	FIP Database		VRI Data Model	☑
Subject Area:	FIP			
Entity Type:	Forest_Inventory_Planning			
Subtype:	Polygon			
Attribute:	**NTS_Map_Number**			
Alias:	**BGC_GR**			

Forestry Term:	NTS/BCGS Adjoining M
Description:	National topographic system (NTS): of mapping, a geographic system under which Canada is divided into numbered primary quadrangles each 4 degrees latitude by 8 degrees longitude.
	Holds the adjoining or adjacent NTS or BCGS map number from which the history component was derived. Normally only used where data attributes are derived from the adjacent or adjoining mapsheet.
Content:	7 character alpha code referencing NTS or BCGS map number
Default:	blank
Permitted Values:	082G003 (BCGS) or 094G12H (NTS)
Use:	Provides a cross-reference to the original NTS or BCGS mapsheet.
Linkage:	Relate to data contained on History records.
Format:	Record type: Polygon Field: 19 Type: Character Width: 7 Dec: Position: 67: 73
Related Attribute:	Mapsheet_Id, Opening_Number

References:	Ministry of Forests, Resources Inventory Branch, Inventory Manual, Forest Classification

Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	Resultant		
Attribute:	**Operability_Cd**		
Alias:	**Operability_Cd**		

Forestry Term:	Operability
Description:	A code describing the operability or inoperability of an area based on the presents or absence or physical barrier or other limitations.
Content:	1 character alpha code indicating operability
Default:	N Unreported
Permitted Values:	N - Unreported I - Inoperable A - Operable in some areas the operability code has been expanded to include operability by harvest method, for example in the North Coast TSA. Users should check with Districts.
Use:	Used to indicate the area of the polygon that is operable. It is used extensively in determining the Operable Land Base for Timber Supply Analyses.
Linkage:	Linkage by Forest Region
Format:	Record type: Resultant Field: 28 Type: Character Width: 1 Dec: Position: 84: 84
Related Attribute:	Result_Area

References:	Ministry of Forests, Resources Inventory Branch, Inventory Manual, Preparation of Forest Cover Source Maps

Model:	FIP Database	VRI Data Model	☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Resultant

Attribute: **Ownership_Cd**

Alias: **Ownership_Cd**

Forestry Term: Ownership

Description: A code indicating the ownership and administrative responsibility for the land contained within the polygon. The major classes of ownership and administrative responsibility include:

- Crown Grants - Private Administration (Codes in the 40's series);
- Federal Lands - Federal Administration (Codes in the 50's series);
- Crown Lands - Provincial Administration (Codes in the 60's series);
- Crown and Private Lands - Private and/or Provincial Administration (Codes in the 70's series);
- Crown and Private Lands - Local Administration (Codes in the 80's series);
- Crown Lands - Provincial Administration under active lease or permit (Codes in the 90's series)

Content: 2 character numeric code for ownership

Default: 1 Unreported ownership

Permitted Values:
01 - Area of Non-Interest Ownership Status unreported
40 - Private - Crown Grant
50 - Federal Reserve
51 - National Park
52 - Indian Reserve
53 - Military Reserve
54 - Dominion Government Block
60 - Crown Ecological Reserve
62 - Crown Forest Management Unit (T.S.A., P.S.Y.U) or Crown Timber Agreement Lands
63 - Crown Provincial Park Class A
64 - Crown Provincial Park Class B
65 - Crown Provincial Park Class C (Park Board)
66 - Crown Provincial Park Class C (No Board)
67 - Crown Provincial Park equivalent or Reserve
68 - Crown Wilderness area within Provincial Forest
69 - Crown Miscellaneous reserves
70 - Crown Active Timber Licence in a TSA or TFL
72 -Crown and Private Schedule "A" and Schedule "B" Lands
74 - Crown and Private timber alienated in watershed
75 - Crown Christmas tree permit
76 - Crown and Private TFL where statue unreported
77 - Crown and Private Woodlot Licence
78 - Crown community pasture, Prince George SSA
81 - Crown and Private under Municipal administration
90 - Crown grazing lease
99 - Crown misc. lease (Fairground, R&G Club site, recreation cottage site).

Use: Used to identify the ownership of the land within a polygon. Used in conjunction with Ownership Character to determine the land that contribute to the Forest Land Base. Conversely, it can be used to define land that is protected because it is located in a National Park, Ecological Reserves, etc.

Linkage: None

Forestry Term: Ownership Character

Description: A code indicating whether or not a given area is available for long-term integrated resource management. For example, land in a National Park, Ecological Reserve, etc. is not available for long-term integrated resource management.

Content: 1 character alpha code designating availability of land for long term integrated resource management

Default: N - Land not available for long-term integrated

Permitted Values: A - Schedule "A" land - Tree Farm Licence
                    B - Schedule "B" land - Tree Farm Licence
                    C - Land available for long-term integrated resource management
                    N - Land not available for long-term integrated resource management Applied to land outside of the Province and areas of non-interest.

Use: Used in conjunction with Ownership Code to determine land that contributes to the forest land base.

Linkage: None

Format: Record type: Resultant
                    Field: 17

Forestry Term: Forest Polygon Area

Description: Total area, in hectares, of the forest cover polygon. The total area should be equal to the sum of the areas for all resultants in that polygon.

Content: 10 character numeric value holding polygon area

Default: Must have value

Permitted Values: 207.240 - area in hectares

Use: To obtain the size, or area of a polygon. For example, it is used to determine the total area on the mapsheet that has been classified as a particular forest cover type. When dealing with subsets of a polygon (e.g. resultants), resultant areas should be used.

Linkage: Linked to resultant areas, resultant areas must sum to polygon area.

Format: Record type: Polygon
                    Field: 4
                    Type: Numeric
                    Width: 10
                    Dec: 3
                    Position: 14: 23

Related Attribute: Result_area

Agency Responsible: Ministry of Forests, Resource Inventory Branch

Model: FIP Database VRI Data Model ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Resultant

Attribute: Forest_Region

Alias: Region

Forestry Term: Forest Region

Description: The Forest Region(s) that fall within the forest cover polygon. Forest Regions are administrative areas that divide the province into six regions: Vancouver, Prince George, Prince Rupert, Kamloops, Nelson, and the Cariboo. These regions have been established.

Content: 2 character numeric code designating Forest Region

Default: 99 - Areas of on-interest

Permitted Values: 31 - Vancouver
32 - Prince Rupert
33 - Kamloops
34 - Prince George
35 - Nelson
36 - Cariboo
99 Area of non-interest

Use: Used to indicate the area of the polygon located (i.e. administered) within a Forest Region

Linkage: None

Format: Record type: Resultant
Field: 29
Type: Character
Width: 2
Dec:
Position: 85: 86

Related Attribute: Forest_District, Result_area

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Polygon

Attribute: **Pri_Util_Lvl_Cd**

Alias: **Pri_Util_Lvl_Cd**

Forestry Term: Primary Utilization Level

Description: The utilization level defines the stump height and top diameter, inside bark, between which the volume of individual trees are determined. The primary level of utilization refers to the "highest" or "closest" use of the individual trees in determining stand volumes for Timber Supply Analyses. For example, volumes per hectare in the Interior Region, include trees with a stump inside bark diameter of 12.5 cm or greater (utilization code '04'). Attributes that are used to determine volumes by different utilization levels include:

                       stump height,
                       stump inside bark diameter,
                       top inside bar diameter,
                       main stem taper

Content: 2 character numeric code indicating one of 2 possible utilization levels

Default: Must have value

Permitted Values: 04 - 12.5 cm + inside bark diameter at 30 cm stump height to a 10 cm inside bark top diameter. Primary utilization level for Interior stands

                       08 - 17.5 cm + inside bark diameter at 30 cm stump height to a 10 cm inside bark top diameter. Primary utilization level for Coast stands

Use: Used to determine volumes per hectare for data summaries and reporting, as well as determining volumes per hectare for Timber Supply Analyses.

Linkage: Determined by Coast_Interior_Cd field; Linked to volume and diameter assignment.

Format: Record type: Polygon
                       Field: 14
                       Type: Numeric
                       Width: 2
                       Dec:
                       Position: 55: 56

Related Attribute: Vol_Per_Ha_Spp_1_Pri_Util_Lvl to Vol_Per_Ha_Spp_6_Pri_Util_Lvl, Mean_Diameter_Pri_Util_Lvl, Culmination_Mai_Pri_Lvl, Stand_Ba_Pri_Lvl, Projected_Ba_Pri_Lvl, Coast_Interior_Cd

Model: FIP Database   VRI Data Model   ☑

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Projected_Age**

Alias: **Projected_Age**

Forestry Term: Projected Age

Description: The age of the layer at the year of projection. The projected age is calculated by adding the projection period (i.e. the difference between projection date and reference year) to the stand age at reference year.

Content: 3 character numeric value holding projected age in years.

Default: 0 years

Permitted Values: 178 years old

Use: Projected Stand Age is use in:
                         - any area, volume, or other summaries based on age or class,
                         - determining the contributing land base in Timber Supply Analyses
                         - forecasting and scheduling short term wood supply and determining when timber will be coming on stream
                         - determining Old Growth, and
                         - conducting Biodiversity Analyses

Linkage: Projected age is calculated using stand_age, reference_year and projected_date. T is used in the calculation of al volumes and diameter values. IT is also used in the calculation of projected_stocking_class_cd, projected_height and projected_age_class_cd

Format: Record type: Layer
                         Field: 56
                         Type: Numeric
                         Width: 3
                         Dec:
                         Position: 199:201

Related Attribute: Stand_Age, Projected_Date, Reference_Year

Model: FIP Database   VRI Data Model   ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Projected_Age_Class_Cd**

Alias: **Projected_Age_Class_Cd**

Forestry Term: Projected Age Class

Description: A code indicating the age class of the stand at the year of projection. Age classes are intervals, or ranges, of ages into which trees, forests, stands, or forest types are divided into for classification and use.

Content: 1 character numeric code indicating projected age class

Default: 0

Permitted Values: 1 Stand age 1 to 20 years
                       2 Stand age 21 to 40 years
                       3 Stand age 41 to 60 years
                       4 Stand age 61 to 80 years
                       5 Stand age 81 to 100 years
                       6 Stand age 101 to 120 years
                       7 Stand age 121 to 140 years
                       8 Stand age 1411 to 250 years
                       9 Stand age 251 + years

Use: Used extensively in :
                       - producing area and volume summaries by projected age classes,
                       - determining land base net-downs for Timber Supply Analyses, and
                       - identifying Old Growth stands.

Linkage: Projected_Age_Class_Cd is calculated based on Projected_Age

Format: Record type: Layer
                       Field: 59
                       Type: Numeric
                       Width: 1
                       Dec:

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Projected_Ba_Pri_Lvl**

Alias: **Projected_Ba_Pri_Lvl**

Forestry Term: Basal Area - Primary Util

Description: Basal Area, in square metres per hectare, of all trees above the primary utilization level at the Year of Projection. The basal Area is based on the outside bark cross section at breast height.

Content: 5 character numeric value holding basal area.

Default: 0.0

Permitted Values: 30.4 m2

Use: Planned input for Growth Models

Linkage: Calculated using Projected_age, site_index, and coefficients based on inventory_type_group_source_cd, fiz_code and Pri_Util_Lvl_cd. Multiplied by table-lookup of stems/ha.

Format: Record Type: Layer
                    Field Name:
                    Field: 74
                    Type: Numeric

Model: FIP Database   VRI Data Model   ☑

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Polygon

Attribute: **Projected_Date**

Alias: **Projected_Date**

Forestry Term: Data Projection Date

Description: The date to which time dependent stand information is projected. Attributes that are projected to a future date include:

                         - Age;
                         - Age Class;
                         - Height Class;
                         - Type Identity;
                         - Stocking Class, etc.

Content: 6 character numeric code holding year, month and day

Default: Must have value

Permitted Values: 910101

Use: Used to determine the date to which time dependent variables in the stand have been projected. All maps within a project area should be projected t the same date.

Linkage: Linked to all projected values including: prj_age, prj_hgt, prj_typid, prj_agecl, prj_hgtcl and prj_stkcl. Affects volumes, MAI and basal area, etc.

Format: Record Type: Polygon
                         Field Name:
                         Field: 12
                         Type: Numeric
                         Width: 6

Subject Area:	FIP			
Entity Type:	Forest_Inventory_Planning			
Subtype:	Layer			
Attribute:	**Projected_Height**			
Alias:	**Projected_Height**			

Forestry Term: Projected Height

Description: The height of the layer at the year of projection. The projected height is determined by applying the projected age to various site index functions for the leading commercial species:

- an ecologically based site index is used (e.g. mid-point of site class) for young stands (i.e. projected age less than 30 years)

- site index functions are used to determine projected height for older stands (i.e. projected age greater than, or equal to 30 years)

Content: Height in metres

Default: 0.0 m

Permitted Values: 29.5 m

Use: Projected Stand Height is used in determining net-downs for Timber Supply Analysis, and producing area and volume summaries by height ranges which do not conform to defined height classes (e.g. ad-hoc height ranges).

Linkage: Projected Height is calculated using projected_age and site_index and coefficients based on tree_species_cd_1 and coast_interior_cd. Projected height is used to calculate projected_height_class_cd.

Format: Record type: Layer

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Projected_Height_Class_Cd**

Alias: **Projected_Height_Class_Cd**

Forestry Term: Projected Height Class

Description: A code indicating the height class of the stand at the year of projection. Height classes are intervals, or ranges, of heights into which trees or stand heights are divided into for classification and use.

Content: 1 character numeric code between 0 and 9 indicating projected height class

Default: 0

Permitted Values: 0   0 m 1 > 0.0 - 10.4 m
                    1   0.1 - 10.4 m
                    2 10.5 - 19.4 m
                    3 19.5 - 28.4 m
                    4 28.5 - 37.4 m
                    5 37.5 - 46.4 m
                    6 46.5 - 55.4 m
                    7 55.5 - 64.4 m
                    8 64.5 +

Use: Used extensively in determining net-downs for Timber Supply Analyses, and producing area and volume summaries by projected age classes

Linkage: Projected_Height_Class_cd is calculated based on Projected_Height

Format: Record type: Layer
                    Field: 60
                    Type: Numeric
                    Width: 1

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Projected_Stocking_Class_Cd**

Alias: **Projected_Stocking_Class_Cd**

Forestry Term: Projected Stocking Clas

Description: A code describing the stocking class of the later at the year of projection. Stocking Class is determined based on the leading commercial species and/or the size (diameter) and number of stems per hectare.

Content: 1 character alpha code indicating projected stocking class

Default: Blank

Permitted Values: \<blank\> N/A
                         0 Immature stands

                         R Immature/Mature Stands:
                           Disturbed 26 to 75% area or volume

                         1 Mature Stands:
                           Not disturbed 26 to 75% by area or volume 76 or more trees per hectare 27.5 cm + dbh

                         2 Mature Stands
                           a. Leading species not lodgepole pine
                                 Fewer than 76 trees per hectare 27.5 cm + dbh

                           b. Leading species llodgepole pine
                                 No information on number of stems 7.5 cm + dbh

                         3 Mature Stands:
                           Leading species lodgepole pine
                            - 311 or more stems per hectare 17.5cm + dbh
                            - 50 % or more of the stems 7.5 cm + dbh are equal to or greater than 12.5 cm dbh.

                         4 Mature Stand:
                            Leading species lodgepole pine
                              - Fewer than 50 % of the stems 7.5 cm + dbh are equal to or greater than 12.5 cm dbh
                              - 0 to 310 stems per hectare 17.5 cm + dbh

Use: Used extensively in Timber Supply Analyses and local resource use plans (LRUPs) for determining the contributing land base and assigning net-downs.

Linkage: Projected_Stocking_Class_Cd may differ from Stocking_Class if stand matures, typically determined by change in Typid.

Format: Record type: Layer
                         Field: 61
                         Type: Character

Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	Layer		
Attribute:	**Projected_Type_Id**		
Alias:	**Projected_Type_Id**		

Forestry Term: Projected Type Identity

Description: Classification of the layer's vegetation cover at the year of projection. The classification reflects the absence or value/importance/status of the vegetation cover with respect to forestry values.

Content: 1 character numeric code indicating type identity

Default: Must have value

Permitted Values: 1 Immature (always stocking class 0)
2 Mature (stocking classes 1, 2, 3, 4)
3 Immature Residual (stocking class R)
4 N.D.R. (Not Sufficiently Restocked)
5 N.C. (Non-Commercial)
6 Non-Productive (includes all N.P.D.)
8 N.T.A. (No Typing Available)
9 Silviculture NSR

Use: Used extensively in Timber Supply Analyses for determining the contributing land base. Also used extensively in area and volume summarise. Used in conjunction with Type Identity at Reference (i.e. vegetation cover at the reference year) to identify changes due to projection (e.g. projection may result in the stand changing from immature to mature).

Linkage: Projected_Type_Id is determined based on Tree_Species_Cd_1, Tree_Species_Cd_2, projected_Age, Stocking_Clas_Cd and/or Non_Projuctive_Forest_Descriptor, Non_Forest_Descriptor.

Attribute: **Range_Unit_NBR**

Alias: **Range_Unit**

Forestry Term: Range Unit

Description: The Range Unit (s) that fall within the forest cover polygon. A Range Unit is a range management area used to prescribe the numbers and kinds of livestock that the land can support. This information is specified in the range management plan. This plan also defines the periods of time when the land will be used for range purposes.

Content: 4 character numeric code cross-referencing the Range Unit name

Default: 7000 - Unreported

Permitted Values: 7000 - Unreported
                    5999 - Unorganised (999), Nelson Region (5)
                    3044 - Adams
                    4143 - Aikman

Use: Used to indicate the area of the polygon located within a Range Unit. Used for general range management purposes, forage summaries, monitoring range utilization, conducting invader/weed species inventories, etc.

Linkage: None

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Resultant

Attribute: **Rec_Activity_Cd**

Alias: **Rec_Activity_Cd**

Forestry Term: Recreation Activity

Description: The Recreation Activity Code (s) that fall within the polygon. The Recreation Activity Code describes the existing or potential recreational use for the land based on its Recreational Features. For example, a Recreation Feature of "waterbody" could have a Recreational Activity of angling, canoeing, etc.

Content: 3 character lower case alpha code designation feature - related recreational activity

Default: --- Not reported

Permitted Values: --- Not reported
                         a--   Angling
                         ac-   Angling, Canoeing
                         and   Angling, Canoeing, Kayaking/rafting

Use: Used to indicate the recreational activities that could occur in the polygon (e.g. angling, canoeing, etc.). This information is used in the planning and development of trails and campsites, preharvest planning, and harvesting decisions (e.g. whether or not to harvest an area based on the recreational potential of the land).

Forestry Term: Recreation Feature

Description: The Recreation Feature (s) that fall within the polygon. This code describes the biophysical, visual or cultural features, and subfeatures, of the area. Typical features include Aquatic, Beaches, Hydrologic Features, Vegetation, Waterfalls and Rapids, Glaciers and Icefields, Landforms, Waterbody, Topographic Features, Rock Formations, Springs, etc. Subfeatures are used to further define the feature. For example, the Springs Feature can be subdivided into Thermal Springs (S1), Freshwater Springs (S2) and Mineral Springs (S3). This attribute can contain up to 3 of the most important features in the resultant.

Content: 6 character alpha-numeric code (3 paired attributes) designating Recreation Feature (s)

Default: ------   Not reported

Permitted Values: ------   Not reported
                    S3----   Mineral Springs
                    S1R3--   Mineral Springs, Mineral Deposits
                    S1R3W3 Mineral Springs, Mineral Deposits, Large Mammals

Use: Used to indicate the recreational features located within each polygon. This information is used in the planning and development of trails and campsites, preharvest planning, and harvesting decisions (e.g. whether or not to harvest an area based on the recreational features/potential of the land).

Linkage: None

Attribute: **Rec_Feature_Sig**

Alias: **Rec_Feature_Sig**

Forestry Term: Recreation Feature Signi

Description: The significance of recreational features within the polygon. The Recreation Feature Significance is a code
                      describing the ability of the Recreational Feature to attract recreation, educational, or scientific users. The code
                      is based on a 4 point rating scale.

Content: 1 character alpha code designating Feature Significance

Default: - Not assigned

Permitted Values: - not assigned
                      A - Very high capability to attract recreational, educational or scientific Provincial (or higher) significance.

                      B - High capability to attract recreational use Regional significance.

                      C - Moderate ability to attract recreational use Local significance (i.e. whether or not to harvest an area based on
                      the recreational potential of the land).

Use: Used to indicate the significance (e.g. ability to attract recreational users, etc.) of the recreational features in the
                      polygon. This information is used in the planning and development of trails and campsites, preharvest planning,
                      and harvesting decisions (e.g. whether or not to harvest an area based on the recreational potential of the land).

Forestry Term: Recreation Management

Description: The Recreation Management Code (s) that fall within the polygon. The recreation management code describes
                          the recommended objectives for guiding preharvest prescriptions in cutblock approval. These objectives result
                          from analyses, management objectives, or approved prescriptions.

Content: 2 character code designating Recreation management class

Default: -- no information available

Permitted Values: -- No information available
                          01 Preservation Approved
                          02 Retention Approved
                          03 Partial Retention Approved
                          04 Modification Approved
                          05 Maximum Modification Approved
                          06 Preservation Recommended
                          07 Retention Recommended
                          08 Partial Retention Recommended
                          09 Modification Recommended

Use: Used to indicate the area of the polygon located within each recreation management code. These codes are
                          used to guide preharvest prescriptions in cutblock approval.

Linkage: None

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Resultant

Attribute: **Rec_Mgmnt_Class_Cd**

Alias: **Rec_Mgmnt_Class_Cd**

Forestry Term: Recreation Management

Description: The Recreation Management Class (es) that fall within the polygon. The recreation management class indicates whether commonly accepted (i.e. normal) local management practices can provide adequate protection to the recreational values within the polygon. For example, areas with outstanding recreational value may be more appropriately managed exclusively for the purposes of recreation and not in conjunction with forest management practices.

Content: 1 character numeric code designating recreation management class

Default: - Not assigned

Permitted Values: - Not assigned
0   Areas of outstanding recreational, educational, scientific or heritage value and is more appropriately managed exclusively for the recreational values noted.

1   Areas requiring special management consideration to protect or maintain recreational values

2   Normal forest management practices are adequate to maintain recreational values.

Use: Used to indicate the type of management practices required to provide adequate protection for the recreational values in the polygon. This information is used in the planning and development of trails and campsites, preharvest planning, and harvesting decisions (e.g. whether or not to harvest an area based on the recreational potential of the land).

Forestry Term: Recreation Opportunity

Description: The Recreation Opportunity Spectrum (s) that fall within the polygon. The recreation opportunity spectrum
                    contains seven categories that describe the opportunity for users to access and experience the recreational
                    values in the area (e.g. primitive, road access, rural, etc.).

Content: 1 character numeric code designating ROS class

Default: 7   Not assigned

Permitted Values: 7   - Not assigned
                    1   - Primitive
                    2   - Semi_primitive, Non-motorized
                    3   - Semi-primitive, motorized
                    4   - Roaded Resource Land
                    5   - Rural
                    6   - Urban

Use: Used to indicate the opportunities for users to access and experience the recreation values in the area. This
                    information is used in the planning and development of trails and campsites, preharvest planning, and harvesting
                    decisions (e.g. whether or not to harvest an area based on the recreation potential of the land).

Model: FIP Database   VRI Data Model   ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: History, Layer, Polygon, Resultant, Ver

Attribute: **Record_Type_Cd**

Alias: **Record_Type**

Forestry Term: Record Type Indicator

Description: One of five record type indicators. This code classifies the information contained within each record as being V (version), P (Polygon), L (Layer), H (History), or R (Resultant)

Content: 1 character alpha code indicating Record Type

Default: Must have value

Permitted Values: V - Version
                         Signifies Version record. It is the first record in the FIP file and contains information relating to the creation and edit data of the FI file and provides a cross-reference to the Digital Design File.

                         P - Polygon
                         Signifies that this is Polygon Record. This is the first record for reach forest cover polygon in the FIP file. Contains information common to the entire polygon (e.g. Polygon Area, Coast/Interior Indicator and ESA designations) and holds counters indicating the number of Layer, History and Resultant records to follow.

                         L - Layer
                         Signifies this is a Layer record. The Layer record (s) follow the polygon record. Contains forest cover information specific to each of the layers (canopies) in a stand.

                         H - History
                         Signifies that this is a History record. The History record (s) follow the Layer record (s). Contains History information describing natural or man-caused activity (e.g. fir, harvesting, silvicultural treatments, etc.) associated with a specific layer in the stand.

                         R - Resultant
                         Signifies that this is a Resultant Record. The Resultant record (s) follow the History record (s). Contains information describing attributes not directly related to the forest cover. Includes such information as TSA/Block, Region and Compartment, Operability, Planning Cell, etc.

Use: Identifies type of record in FIP file

Linkage: Implicitly defines information content, fields and format of record.

Format: Record type: History, Layer, Polygon, Resultant, Version
                         Field: 1
                         Type: Character
                         Width: 1
                         Dec:
                         Position: 1: 1

Related Attribute: Record_Type is the first field on every record in the FIP file.

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Reference_Year**

Alias: **Reference_Year**

Forestry Term: Reference Year

Description: The calendar year for which the time dependent attributes in the layer are most reliable. For example, if time dependent attributes such as age and height are determined in a specific year (e.g. 1991), then that year is recorded as the reference year.

Content: 2 character numeric code indicating year for which the attributes are most reliable

Default: Must have value

Permitted Values: 53 to present year

Use: The reference year forms the base from which time dependent attributes with the layer are projected. It is also used to evaluate the currentness of the inventory (e.g. the date the information was captured/measured).

Linkage: May be used in projecting stand values if Projection Year specified is less than Reference year.

Format: Record type: Layer
Field: 55
Type: Numeric
Width: 2
Dec:
Position: 197:198

Related Attribute: Projected_Date

Model: FIP Database VRI Data Model ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Resultant

Attribute: **Result_Area**

Alias: **Result_Area**

Forestry Term: Resultant Area

Description: The area of the resultant polygon. The resultant area is determined during Overlay Processing. Resultant areas within a polygon must add to the entire polygon area.

Content: 5 character numeric value holding resulting area

Default: Must have value

Permitted Values: 400.0 ha - cannot exceed 400.0 ha
   0.4 ha

Use: Used in all area based summaries that require overlay information (e.g. ownership, TSSA, operability, etc.).

Linkage: Resultant areas should sum to Polygon_Area

Format: Record type: Resultant
Field: 18
Type: Numeric
Width: 5
Dec: 1
Position: 51: 55

Related Attribute: Resultant_No and all Forest cover and Resultant Attributes

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Polygon

Attribute: **Sec_Util_Lvl_Cd**

Alias: **Sec_Util_Lvl_Cd**

Forestry Term: Secondary Utilization Le

Description: The utilization level defines the stump height and top diameter, inside bark, between which the volume of individual trees are determined. The secondary level of utilization refers to a "medium" use of the individual trees in determining stand volumes for Timber Supply Analyses. For example, volumes per hectare in the Interior Region, include trees with a stump inside bark diameter of 15.5 cm or greater (utilization code '08'). Attributes that are used to determine volumes by different utilization levels include: stump height, stump inside bark diameter, top inside bark diameter, main stem taper.

Content: 2 character numeric code indicating one of 2 possible utilization levels

Default: Must have value

Permitted Values: 08 17.5 cm + inside bark diameter at 30 cm stump height to a 10 cm inside bark top diameter. Secondary utilization level for Interior stands

                     10 22.5 cm + inside bark diameter at 30 cm stump height to a 10 cm inside bark top diameter. Secondary utilization level for Coast stands

Use: Used to determine volumes per hectare for data summaries and reporting, as well as volumes per hectare for Timber Supply Analyses.

Linkage: Determined by Coast_Interior_Cd field; Linked to volume and diameter assignment.

Format: Record type: Polygon
                     Field: 15

Model: FIP Database VRI Data Model ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Polygon

Attribute: **Secondary_Element_Cd**

Alias: **Secondary_Element_Cd**

Forestry Term: Secondary Layers for C

Description: A code indicating that the stand has a secondary layer despite being described as having only one layer in the FIP file (i.e. only one Layer Record). The code defines the "type" of secondary layer; for example, Veterans, Immature, etc. This code is only found on records collected (e.g. CC Card Source Records) prior to the present method of collecting and storing information by layer.

Content: 1 character numeric code indicating the presence and type

Default: Blank

Permitted Values: 0 Immature component
1 Seed Tree
2 Veterans
3 Volume

Use: Used to identify multi-layered stands where data source is from cc card source record (s).

Linkage: None

Format: Record type: Polygon
Field: 17
Type: Character
Width: 1
Dec:
Position: 60: 60

Related Attribute: Secondary_Element_Spp_Cd, Card_Source_Cd

References: Ministry of Forests, Resources Inventory Branch, Resource Inventory Section

Agency Responsible: Ministry of Forests, Resource Inventory Branch

Model: FIP Database   VRI Data Model   ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Polygon

Attribute: **Secondary_Element_Spp_Cd**

Alias: **Secondary_Element_Spp_Cd**

Forestry Term: Secondary Element Spe

Description: A code identifying the species composition for the secondary layer of stands with a secondary layer but only one layer record (see Secondary Layer for CC Records). A maximum of 3 species can be identified for each secondary element code.

Content: 2 character alpha code indicating species composition.

Default: blank

Permitted Values: B - Balsam

Use: used to identify secondary species in multi-layered stands where the data source is cc card source record.

Linkage: None

Format: Record type: Polygon
                  Field: 18
                  Type: Character
                  Width: 6

Model: FIP Database   VRI Data Model   ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: History

Attribute: **Separator_Char**

Alias: **Separator_Char**

Forestry Term: Activity Separation Char

Description: A character to indicate if the historical activity was completed in a single year, or whether it occurred as discontinuous or continuous activity over several years. A blank character indicates that the activity was complete in a single year. A comma ',' indicates that the activity was discontinuous and occurred in more than one year. A dash '-' indicates that the activity was continuous over more than 1 year.

Content: 1 character alpha code indicating continuity of activity

Default: Must have value, blank is a valid value

Permitted Values: <Blank> : Infers that the activity took place in a single year.

                    ' : Discontinuous activity

                    - : Continuous activity

Use: Used to distinguish continuous from discontinuous activity

Linkage: None

Format: Record Type: History

Model: FIP Database   VRI Data Model   ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Site_Class_5m**

Alias: **Site_Class_5M**

Forestry Term: 5 Metre Site Classes

Description: Site Index assigned to the closest 5m interval. For example, a site index of 12.4 is assigned a site class of 10. A site index of 12.5 is assigned a site class of 15.

Content: 2 character numeric value holding site index to the nearest 5m interval from 5 to 55 metres.

Default: 0

Permitted Values: 10 metre class
                    25 metre class

Use: Used to provide a more detailed discrimination of site class. Historically, site classes were limited to Good, Medium, Poor and Low.

Linkage: Calculated using Site_Index.

Format: Record Type: Layer
                    Field Name:
                    Field: 64
                    Type: Numeric
                    Width: 2
                    Dec:
                    Position: 216:217

Related Attribute: Site_index

---

Model: FIP Database   VRI Data Model   ☑

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Site_Index**

Alias: **Site_Index**

Forestry Term: Site Index

Description: An expression of the forest site quality based on stand age and height. Site index is determined using stand age, stand height and Ministry of Forests' and other site index equations. These equations are based on reference age 50 years bha (breast height age).

Content: 4 character numeric value for site index in metres at 50 bha (breast height age)

Default: 0.0 m

Permitted Values: 32.5 metres

Use: Used extensively in Timber Supply Analyses and Local Resource Use Plans (LRUPs) for determining the Contributing Land Base and assigning net-downs.

Linkage: Site_index is calculated using stand_age, stand_height and coefficients based on tree_speceis_cd_1 and coast_interior_cd. Site_index was historically used to calculate Hist_Class_S for some stands. Used in the derivation of projected height and in the assignment of volumes and diameters.

Format: Record type: Layer
                     Field: 62
                     Type: Numeric
                     Width: 4
                     Dec: 1
                     Position: 210:213

Model: FIP Database   VRI Data Model   ☐

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Site_Index_Estimated**

Alias: **Site_Index_Estimated**

Forestry Term: Estimated Site Index

Description: The estimated site index assigned to a forest type when the site index derived from the stand age and height
                         does not reflect the perceived or actual productivity of the stand. Estimated site index is required for young
                         stands (e.g. less than30 years), for suppressed stands that have been released (e.g. after a disturbance) and for
                         stands with TYPID 4, 5 and 9. Estimated Site Index is based on an assessment of the physical and biological
                         factors.

Content: 2 character numeric value holding estimated site index in metres (bha 50)

Default: 0.0 m

Permitted Values: 17 metres

Use: Used in assigning culmination mai for young stands in Timber Supply Analyses and Local Resource Use Plane
                         (LRUPs). Also used as a basis for applying net-downs for low sites.

Linkage: used in the derivation of projected height and in the assignment of volumes and diameters

Format: Record Type: Layer
                         Field Name:
                         Field: 63
                         Type: Numeric
                         Width: 2

Entity Type: Forest_Inventory_Planning

Subtype: Resultant

Attribute: **Special_Cruise_Number**

Alias: **PSYU**

Forestry Term: Public Sustained Yield U

Description: The numeric code of the Public Sustained Yield Unit (s) (PSYU) that fall within the forest cover polygon. PSYUs
                     are areas of land, usually a natural topographic unit determined by drainage areas. Includes PSYUs, Tree Farm
                     Licences (TFL), Tree Farms (TF), Major Parks and Ecological Reserves, Woodlot Licences, and miscellaneous
                     areas.

Content: 4 character numeric code which references the respective PSYU, TFL, etc.

Default: 9999 - area outside PSYU's

Permitted Values: Refer to FRGIS for complete listing

                     9999 - area outside PSYU's, eq Victoria-Saanich, Vancouver-Delta and areas outside Province.

                     131 - Upper Kootenay PSYU
                     161 - Fernie PSYU
                     314 - TFL 14

Use: Used to indicate the area of the polygon that is located within a PSYU, TFL, TF, Woodlot, etc. Used in
                     conjunction with the Forest Inventory Zone to assign stand volumes. Also used in net-downs associated with
                     Environmentally Sensitive Areas in Timber Supply Analyses.

Linkage: Used as index for look up of DWB coefficients/factors when netting down gross volumes.

Format: Record type: Resultant

Subject Area:	FIP		
Entity Type:	Forest_Inventory_Planning		
Subtype:	Layer		

Attribute: **Stocking_Class_Cd**

Alias: **Stocking_Class_Cd**

Forestry Term: Stocking Class at Refere

Description: A code describing the stocking class of the layer at the reference year. Stocking class is based on leading
                    commercial species, stand age and/or the size (diameter) and number of stems per hectare.

Content: 1 character alpha code indicating stocking class

Default: Blank

Permitted Values: R Residual
                    0 Immature Stands
                    1 Stocking Class 1
                    2 Stocking Class 2
                    3 Stocking Class 3
                    4 Stocking Class 4

Use: Used extensively in identifying stands which contribute to the timber supply. Stocking Class 2, 3 and 4 stands
                    are frequently netted-out of the Contributing Land Base.

Linkage: Stocking class may be calculated using a table indexed by inventory_type_group_source_cd,
                    crown_closure_class, height_class_cd and age_class_cd or it may be estimated using
                    inventory_type_group_source_cd and stand_age. Stocking class is used in calculating all volumes.

Format: Record type: Layer
                    Field: 52
                    Type: Character
                    Width: 1
                    Dec:
                    Position: 194:194

Model: FIP Database   VRI Data Model   ☑

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Stocking_Class_Source_Cd**

Alias: **Stocking_Class_Source_Cd**

Forestry Term: Stocking Class Source C

Description: A code indicating whether the layer's stocking class was input (e.g. measured or estimated) or derived.

Content: 1 character alpha code holding stocking class source code

Default: Blank

Permitted Values: T Table derived
                        I   Input
                        D Derived

Use: Indicates the reliability of the stocking class code

Linkage: Stocking class source is set based on origin of stocking_class_cd.

Format: Record type: Layer
                        Field: 53
                        Type: Character

Forestry Term: Species Composition - L

Description: A code describing the leading commercial species in the layer. The species with the leading highest percent composition (e.g. gross volume or, if a very young stand, the relative number of stems per hectare) is identified as the leading commercial species. Species must be above a specified diameter to be recognized in the species composition of the layer. Species are described in terms of Genus, Species, and five genus values recognized in the Province.

Content: 3 character alpha code indicating commercial species

Default: blank

Permitted Values: <blank> No species recorded
AC Balsam poplar (Populus balsamifera)
    Black Cottonwood   (Populus balsamifera)

AT Aspen (Populus tremuloides)
B   True fir (Abies spp.)
BL Alpine fir (Abies lasiocarpa)

Model: FIP Database   VRI Data Model   ☑

Subject Area: FIP

Entity Type: Forest_Inventory_Planning

Subtype: Layer

Attribute: **Tree_Species_Pct_1**

Alias: **Tree_Speciees_Percentage_1**

Forestry Term: Percentage Species Co

Description: Percentage of the layer that the leading commercial species occupies. For older stands, tree species percentage
                    is based on relative gross volume (i.e. whole stem volume); for younger stands, tree species percentage is based
                    on the number of stems per hectare. Tree species percentage is estimated to the nearest percent for all living
                    trees above a specified diameter

Content: 3 character numeric value holding percent composition

Default: Must have value, may be 0 if no species

Permitted Values: 100

Use: Tree Species Percentage is used in:
                    - determining stand volumes,
                    - identifying stands with specific species composition (i.e. pure),
                    net-downs in Timber Supply Analyses, etc.

Linkage: Linkage exist in determination of stand and species volumes

Format: Record type: Layer
                    Field: 11
                    Type: Numeric

Subtype:	Layer		
Attribute:	**Vol_Per_Ha_Spp_1_Pri_Util_Lvl**		
Alias:	**Vol_Per_Ha_Spp_1_Pri_Util_Lvl**		

Forestry Term:	Leading Species Volume
Description:	Net volume per hectare of the leading commercial species at the primary utilization level. Net volume per hectare is determined as gross volume less decay, waste, and breakage. Depending on the magnitude of the species' decay, waste, and breakage, the net volume for the leading species may be lower than volumes for other species in the stand. Net volumes are calculated for Rank 1 layers only, Typid 1 through 3.
Content:	7 character numeric value holding net species volume per ha.
Default:	0.0 m3/h
Permitted Values:	287.1 m3/ha 0.0 m3/ha
Use:	Volumes per hectare - Secondary Utilization is used to determine: - volume for leading species at the secondary utilization level, - total volume per hectare (of all species) at the secondary utilization level, - total volume (of all species) at the secondary utilization level, - volumes per hectare for specific species or groups of species (e.g.. Volume of coniferous species),
Linkage:	Volumes are calculated using projected_age, site_index and stocking_class_cd, with coefficients based on fiz_code and inventory_type_group_source_cd. Per hectare values are apportioned based on percent species composition. Utilization is determined by sec_util_lvl_cd which in turn is based on coast_interior_cd. Net volumes are calculated using dwb factors based on special_cruise_number.

Subtype:	Layer		

Attribute: **Vol_Per_Ha_Spp_2_Sec_Util_Lvl**

Alias: **Vol_Per_Ha_Spp_2_Sec_Util_Lvl**

Forestry Term: Second Species Volume

Description: Net volume per hectare of the second commercial species at the secondary utilization level. Net volume per hectare is determined as gross volume less decay, waste, and breakage. Depending on the magnitude of the species' decay, waste, and breakage, the net volume for the second species may be lower than volumes for species with a lower percent composition. Net volumes are calculated for Rank 1 layers only, TYPID 1 through 3.

Content: 7 character numeric value holding net species volume per hectare in cubic metres

Default: 0.0 m3/ha

Permitted Values: 135.2 m3/ha

Use: Volume per hectare - Primary Utilization is used to determine:

- volume for second species at the primary utilization level;
- total volume per hectare (of all species) at the primary utilization level;
- total volume (of all species) at the primary utilization level;
- volumes per hectare for specific species or groups of species (e.g. volume of coniferous species), etc.

Linkage: Volumes are calculated using projected_age, site_index and stocking_class_cd, with coefficients based on fiz_code and inventory_type_Group_source_cd. Per hectare values are apportioned based on percent species composition. Utilization is determined by pri_util_lvl_cd which in turn is based on coast_interior_cd. Net volumes are calculated using dwb factors based on special_cruise_number.
