

Combined Heat and Power

What is combined heat power (CHP)?

CHP technologies utilize a combustion or gasification process to convert energy stored in biomass to heat and power. The technology can be used to displace diesel in remote communities, heat buildings or process such as dry kilns or green houses.

SOME KEY FACTS

- Energy outputs from 40kW to several MW
- Steady production of baseload power
- Opportunity for harvest operations
- Can use heat for additional processes
- Can help with wild fire mitigation
- Long term job opportunity
