RN and RPN Decision Support Tool (Clinical Practice Guidelines) for Identification and Early Treatment of Influenza-Like Illness (ILI) Symptoms during an Influenza Pandemic in the Absence of a Medical Practitioner or Nurse Practitioner

Purpose
This document provides registered nurses (RNs) and registered psychiatric nurses (RPNs) with guidance in screening and early intervention for clients who appear to be experiencing influenza-like illness (ILI), under the following circumstances:

1) the local Medical Health Officer or the Provincial Health Officer has determined that pandemic influenza is circulating in or around the client’s community (this may be confirmed by the RN or RPN through official surveillance reports, such as from the BC Centre for Disease Control, or through information on the website of the Office of the Provincial Health Officer) and

2) a medical practitioner (MP) or nurse practitioner (NP) is not available to examine and diagnose the client.

The guidelines provide RNs and RPNs with the decision-support tools required to screen and treat symptomatic clients with oseltamivir antiviral medication, and refer clients to a MP or NP when needed.

Through these efforts it is expected that RNs and RPNs will assist in reducing the number of clients requiring hospitalization or treatment in an intensive care unit for influenza-related complications during an influenza pandemic.

Authorization
Relevant regulation under the Health Professions Act and applicable Nursing Scope of Practice Standards, Limits and Conditions provide the required authorization:

Registered Nurses
- The Nurses (Registered) and Nurse Practitioners Regulation.
- See Scope of Practice for Registered Nurses: Standards, Limits and Conditions.

Registered Psychiatric Nurses
- The Nurses (Registered Psychiatric) Regulation.
- See Scope of Practice for Registered Psychiatric Nurses: Standards, Limits and Conditions including limits and conditions on Schedule I drugs (antivirals) for children under the age of 4.

Licensed Practical Nurses
- The Nurses (Licensed Practical) Regulation authorizes LPNs to compound, dispense and administer a Schedule I antiviral (oseltamivir) with an order from an authorized health professional.
- See Scope of Practice for Licensed Practical Nurses: Standards, Limits and Conditions.

Background
In an influenza pandemic, laboratory diagnosis of ILI in an individual is not required to consider treatment. The presence of ILI in the home, community or neighbouring
RN and RPN Decision Support Tool (Clinical Practice Guidelines) for Identification and Early Treatment of Influenza-Like Illness (ILI) Symptoms during an Influenza Pandemic in the Absence of a Medical Practitioner or Nurse Practitioner

community, supported by laboratory diagnosis that pandemic influenza is occurring in the community or region, is sufficient.

**Potential Causes of ILI**

*Viral infection*: Influenza A or B viruses, Adenovirus, Rhinovirus, Parainfluenza viruses, Human Coronavirus, Respiratory Syncytial Virus (RSV) all cause many of the same symptoms. During an influenza pandemic, most cases of ILI are caused by infection due to influenza virus.

*Bacterial infection*: Mycoplasma pneumonia, Chlamydia pneumonia, Bordetella pertussis, Streptococcus pneumonia, and Legionella may cause some symptoms similar to influenza virus infection and may be complications of influenza infection. See the decision support tool for further guidance about how to respond to secondary complications such as respiratory bacterial infections.

**Epidemiology**
The incubation period, period of communicability and method of transmission of a pandemic strain of influenza is expected to be similar to seasonal human Influenza strains:

- Incubation period: On average 3 to 4 days but can range from 1 to 7 days
- Period of communicability: 24 hours before to up to 7 days after onset of illness.
  - Shedding of the virus may be prolonged in children or immuno-compromised persons of any age.
- Method of transmission: primarily droplet and direct and indirect contact
- Transmission by asymptomatic persons is possible but is more efficient when symptoms such as coughing, are present and viral shedding is high (i.e. early in the symptomatic period)

**Symptoms of ILI**
Symptoms of ILI include acute onset of respiratory illness with fever over 38°C (80% of all cases) and cough with one or more of the following:

- Sore throat
- Runny nose
- Headache
- Fatigue
- Muscle aches
- Decreased appetite
- Joint pain
- Weakness

Gastrointestinal symptoms (nausea, vomiting or diarrhea), may be present, particularly in children less than 5 years of age, but are not diagnostic of influenza. Fever may be less common in infants under 1, seniors over 65, and those with chronic illnesses. Presentation may include exacerbation of chronic condition, confusion and/or disorientation.

**Treatment with oseltamivir antiviral medication**
Oseltamivir is a neuraminidase inhibitor antiviral medication that is the mainstay of the BC provincial antiviral stockpile. Oseltamivir can be effective in preventing progression of influenza to its most severe manifestations (such as pneumonitis, pneumonia or exacerbation of an underlying chronic medical condition) if administered as soon as possible after onset of influenza symptoms with greater benefit if given within 12 hours versus 48 hours. Oseltamivir may also be used after the 48 hour period, in persons who are already moderately or severely ill to reduce further progression.
Distribution of Oseltamivir
The BC Centre for Disease Control (BCCDC) maintains an antiviral stockpile on behalf of the province. During a pandemic most will be distributed through pharmacies across BC. The BCCDC has also worked with Health Authorities and First Nations stakeholders to position oseltamivir in remote communities. RNs and RPNs screening and dispensing oseltamivir from the provincial pandemic stockpile under these guidelines need to access medication through existing remote community distribution mechanisms.

Monitoring and Recording Antiviral Administration
RNAs and RPNs will be accountable for recording and reporting on the provision of antiviral medication in accordance with pandemic specific guidelines that will be available through the Provincial Health Officer/BCCDC. RNs and RPNs are responsible for returning unused supplies, and assisting their employer to resolve issues about tracking the use of antiviral supplies originating from the BC pandemic stockpile issued to the RN or RPN.
**Step 1: History of Present Illness & Review of Systems**

**CLINICAL PRESENTATION OF ILI:**
Does the client have symptoms that are consistent with ILI?
- Primary Symptoms:
  - Sudden onset of cough & fever 38°C or higher
    - Chills or “feverishness” may be used when temperature has not been recorded &/or has been treated within a few hours by the client at home using acetaminophen or similar OTC medications
  - At least one of the following secondary symptoms:
    - Fatigue, muscle aches, sore throat, headache, runny nose, decreased appetite, joint pain or weakness

* Fever may be absent in infants under 1 year, people over 65 and the chronically ill. Presentation may include exacerbation of chronic condition, confusion and/or disorientation

**SEVERITY INDICATORS:**
Does the client have any indicators of moderate to severe (in bold) influenza?
- Exacerbation/instability of chronic condition post onset
- Shortness of breath, wheezing, rapid or difficulty breathing
- Chest pain
- Bloody or coloured sputum
- Fever 39°C or higher

If the client is a child under 5 yrs*, does he/she have any of the following additional indicators of moderate to severe (in bold) influenza?
- Not eating or drinking enough fluids
- Decreased urine output or other signs of dehydration (i.e. sunken fontanel in infants)
- Irritability: Not wanting to play or be held
- Non-responsiveness and/or severe lethargy
- Not urinating
- Respiratory distress (i.e. grunting, stridor, cyanosis, tachypnea, chest indrawing
- Febrile seizures
- Temp >38.5 in infant under 3 months

**RISK FACTORS:**
Does the client have any medical risks?
- Age <5 yrs (especially < 2 yrs) or >64 yrs
- Pregnancy (especially 2nd & 3rd trimester)
- Post-partum (up to 6 weeks)
- Body Mass Index over 35
- Adults & children with chronic health conditions including:
  - Cardiac disorders
  - Asthma, cystic fibrosis, bronchopulmonary disease, COPD
  - Diabetes & other metabolic diseases
  - Cancer
  - Immunodeficiency or immunosuppression
  - Renal disease
  - Anaemia or hemoglobinopathies
  - Other conditions that compromise the management of respiratory secretions or increase the risk of aspiration

* Fever may be absent in infants under 1 year, people over 65 and the chronically ill.

**Does the client have any non-medical risks?**
Assess client’s overall situation: living conditions, lifestyle etc., and the availability of care if the clinical situation deteriorates quickly.

**Does the client live in a remote or isolated area?**

**Step 3: Treatment Decisions**

1. **Moderate to Severe ILI with or without risk factors**
   - Provide oseltamivir antiviral medication as soon as possible preferably within 24-48 hrs of symptoms
   - Provide information on signs of worsening condition, symptom management, medication administration and infection control
   - Inform client to seek immediate medical assistance if condition worsens
   - Consult with a MP or NP if ILI is moderate. Consult and/or refer to a NP, MP or hospital if ILI is severe

2. **Mild ILI with risk factors &/or other considerations**
   - Provide oseltamivir antiviral medication as soon as possible preferably within 24-48 hrs of symptoms
   - Provide information on signs of worsening condition, symptom management, medication administration, and infection control
   - Inform client to seek immediate medical assistance if condition worsens
   - Consult with MP or NP for clients under 1 year, or with risks

3. **No ILI or Mild ILI without risk factors**
   - DO NOT provide oseltamivir
   - Inform client to remain at home until symptom-free for 24 hrs
   - Provide information on signs of worsening condition, symptom management and infection control
   - Provide advice for reassessment if condition worsens

Follow-up to assess client’s condition: For infants under one year phone parents within 24 hours, for clients with risk factors or moderate ILI contact within 24-48 hours.

Note: Infants and young children can experience rapid changes in their health condition; therefore it is extremely important to inform parents to watch for signs of deteriorating health status and to seek immediate medical assistance.
Client Education
Provide client with information on managing illness, over the counter medications, infection control, signs of worsening condition and if applicable, medication administration.

Managing the illness
- Explain the diagnosis of ILI and that the expected course of illness is resolution of symptoms within one week
- Inform client to recuperate at home until they are feeling better (other than lingering dry cough which can occur in some cases) and client is able to resume all their usual activities
- Encourage client to increase bed rest away from others, if possible, until symptoms improve
- Reinforce the importance of maintaining adequate hydration and discuss the signs and symptoms of dehydration in infants, children and elderly
- Inform client on options for treating fever and symptoms with over the counter medications
- Explain the importance of creating a smoke-free environment
- Review and provide client with relevant written information (updated information on the pandemic strain of influenza will be available on the PHO website, HealthLinkBC Files and the BCCDC)
- Inform client to seek immediate medical assistance if condition worsens (see signs of worsening condition)
- Inform client to call HealthLink BC (call 811) if they have questions or need advice. This service provides nursing advice 24 hours a day 7 days a week

Infection control measures
- Explain the importance of reducing other people’s exposure to respiratory secretions from coughing and sneezing
- Encourage clients who are actively sneezing or coughing to use tissues, or disposable surgical masks if available
- Inform client that masks are not normally recommended in the home setting, although clients who are very actively sneezing and coughing can use surgical masks when being attended by caregiver
- Demonstrate technique for coughing into elbow if tissues are not available
- Explain importance of disposing tissues in a garbage bag
- Provide education to client and caregiver on hand hygiene (e.g. before and after eating, after sneezing, coughing and toileting)
- Provide education on use of alcohol-based hand cleaners
- Recommend cleaning of commonly touched surfaces (e.g. doorknobs, counters) with household cleansers, after client use
- Recommend, where possible, that pregnant women, especially those in their late pregnancy, or those with chronic diseases NOT be caregivers
**Signs of worsening condition**

- Inform client of signs of moderate to severe ILI and to seek immediate medical attention from a MP, NP or hospital if they experience **severe (in bold below)** ILI. Signs include:
  - Exacerbation/instability of chronic condition post onset
  - Shortness of breath, wheezing, rapid or difficulty breathing
  - Chest pain
  - Bloody or coloured sputum
  - Fever 39°C or higher
- Persons 65 years and older do not always present with high fever; confusion &/or disorientation are more likely
- Inform client of additional signs of moderate to **severe (in bold below)** influenza in children, under 5, if appropriate. Signs include:
  - Not eating or drinking enough fluids
  - Decreased urine output or other signs of dehydration (i.e. sunken fontanel in infants)
  - Irritability: Not wanting to play or be held
  - Non-responsiveness and/or severe lethargy
  - Not urinating
  - Respiratory distress (i.e. grunting, stridor, tachypnea, chest indrawing)
  - Febrile seizures
  - Temperature greater than 38.5 in infants less than 3 months of age
- Inform client to call the RN, RPN, 811, 911 or First Responders for assistance in obtaining emergency services if the client is unable to contact a MP, NP or hospital and condition worsens.

**Note:** Potential complications of ILI include exacerbation of chronic conditions, viral pneumonitis, viral pneumonia, bacterial pneumonia or secondary infection and sepsis. In children, bronchiolitis, croup and pneumonia are more common complications.

**Over the counter medications**

- Acetaminophen (Tylenol) and Ibuprofen (Motrin, Advil) can be used to reduce fever and relieve some symptoms. These products are recommended for children and most adults
- Acetylsalicylic Acid (ASA, Aspirin) and Ibuprofen (Motrin, Advil) are not recommended for pregnant women as they can affect fetal kidney function
- Acetylsalicylic Acid (ASA, Aspirin) is not recommended for children and youth <20 years as this product can lead to Reye’s syndrome
- Over the counter cold medications are not recommended for infants and children <6 years
- Instruct on safe usage of over the counter medications. Inform clients that dosage recommendations for children less than 12 are dependent on the child’s weight and should not exceed adult recommended doses

**Oseltamivir administration (for clients receiving oseltamivir only)**

- Explain medication and side effects
- Inform client to complete the full course of oseltamivir. Clients should NOT stop treatment because they start to feel better
Inform client to call HealthLinkBC (call 811) for advice regarding medication administration, side effects, etc. before deciding to stop medication.

Inform client that the most common side effect of oseltamivir is mild stomach upset or nausea.

**Oseltamivir dosage**

**Note:** See Scope of Practice for Registered Psychiatric Nurses: Standards, Limits and Conditions including limits and conditions on Schedule I drugs (antivirals) for children under the age of 4.

**Consultation and/or referral**

- **RPNs:** Refer children under the age of 4 who are experiencing ILI to a medical practitioner or NP. Consult with an MP or an NP on clients with mild ILI and risk factors and clients with moderate ILI.
- **RNs:** Consult with an MP or an NP on clients under 1 year, clients with mild ILI and risk factors and clients with moderate ILI.
- **RNs and RPNs:** Consult with and/or refer to an MP, NP or a hospital any client who is experiencing severe ILI.

**Client Monitoring and Follow-up**

Complete a follow-up phone call to assess changes in client’s condition within:

- 24 hours for clients under 1 year of age (RNs only\(^1\))
- 24-48 hours for clients with mild ILI and risk factors, and clients with moderate ILI

\(^1\) See Scope of Practice for Registered Psychiatric Nurses: Standards, Limits and Conditions including limits and conditions on Schedule I drugs (antivirals) for children under the age of 4.
RN and RPN Decision Support Tool (Clinical Practice Guidelines) for Identification and Early Treatment of Influenza-Like Illness (ILI) Symptoms during an Influenza Pandemic in the Absence of a Medical Practitioner or Nurse Practitioner

Documentation

Follow employer protocols and/or procedures for recording and reporting oseltamivir administration and any pandemic specific reporting forms from the PHO/BCCDC. Follow CRNBC Documentation Practice Standard for Registered Nurses and Nurse Practitioners and CRPNBC Documentation Practice Standard for RPNs.
