Osteoarthritis in Peripheral Joints – Diagnosis and Treatment

Effective Date: September 15, 2008

Scope

This guideline summarizes current recommendations for assessment, diagnosis and treatment of osteoarthritis (OA) in peripheral joints for patients 19 years-of-age and older. Discussion will include patient education, rehabilitation, medications, and surgical choices as viewed within the chronic disease management context. A medication table is enclosed for reference.

Diagnostic Code: 715 (Osteoarthritis)

Introduction

Arthritis is a leading cause of long-term disability and one of the leading economic burdens to society. From a 2005 survey, 10.8% of British Columbians aged 12-64 and 42.4% aged 65 and over self-report that they have arthritis or rheumatism.\(^1\) OA is the most common form of arthritis. From British Columbia 2005/2006 Medical Services Plan (MSP) claims data (physician billing, hospitalizations and PharmaCare claims), approximately 306,000 people (6.03% of the population) received medical services for OA.\(^2\)

OA should not be considered simple wear and tear of joints. It is a slowly progressing disorder of unknown cause, but risk factors include: obesity, muscle weakness, heavy physical activity, inactivity, previous trauma, reduced proprioception, family history\(^3\) of primary generalized OA, and mechanical factors. Often there is a progressive loss of articular cartilage and abnormal bone formation. OA symptoms usually begin in mature adults, presenting with minimal morning stiffness or stiffness after inactivity, pain in and around the affected joints (particularly with weight-bearing exercise), and transient pain alleviated with inactivity and rest. The joints usually have bony enlargement, crepitus with motion, and/or limitation of motion. Inflammation is usually absent or very mild. Any joint may be affected but most often involve the hands, great toes, spine, knees and hips.

Because there is no known cure for OA, the treatment goals are to: reduce pain, maintain or improve joint mobility, limit functional disability and improve self-management. The four pillars of treatment are: patient education, rehabilitation, medications and referrals (surgery and non-surgical). These are best achieved using a multidisciplinary approach and multi-modal treatments.
**Recommendation 1** Follow an organized approach to achieve an accurate diagnosis and functional assessment

OA is a clinical diagnosis. There are no tests that are completely reliable in making the diagnosis. Current tests are primarily used to monitor the disease or exclude other types of arthritis. Radiographs may indicate OA but may not relate to symptoms. People with symptoms of osteoarthritis are usually mature adults and the elderly. As the patient is being considered for OA, it is recommended that assessment include the following:

A. Patient History
   B. Physical Examination
   C. Assessment to Exclude Other Diagnoses
   D. Investigations
   E. Clinical Impression and Factors to Consider Prior to Treatment and Management

### A. Patient History

<table>
<thead>
<tr>
<th>FACTORS SUGGESTIVE OF OA (REFER TO APPENDIX A: HISTORY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Gradual onset</td>
</tr>
<tr>
<td>• Absence of inflammation (morning stiffness &lt; 30 minutes, minimal heat, minimal swelling, no redness)</td>
</tr>
<tr>
<td>• Absence of systemic symptoms or signs suggesting alternate diagnoses (Red Flags in Appendix C)</td>
</tr>
<tr>
<td>• Joint pain with activity</td>
</tr>
<tr>
<td>• Joints most likely affected: hip, knee, cervical and lumbar spine, thumb CMC (Carpo-Metacarpal), finger PIP (Proximal Interphalangeal), DIP (Distal Interphalangeal), and first MTP (Metatarsophalangeal) joint</td>
</tr>
</tbody>
</table>

</tbody>
</table>
B. Physical Examination *(For more detailed information, see Appendix B: Physical Examination)*

### PHYSICAL EXAMINATION
- Height and weight (refer to attached BMI chart)
- Gait (limp)
- Muscle wasting
- Inflammation (heat, redness, swelling)
- Range of motion
- Pain on movement or at end of range

### SPECIFIC ABNORMAL JOINT FINDINGS

#### Hip Examination
- Flexion causes external rotation
- Limited internal rotation (in flexion)
- Limited abduction
- Fixed flexion deformity
- Leg length discrepancy
- Trendelenburg position

#### Knee examination
- Quadriceps wasting
- Valgus or varus deformity
- Flexion deformity
- Patellar pain

#### Hand examination
- Bouchard’s and Heberden’s nodes
- CMC squaring of the thumb

C. Assessment to Exclude Other Diagnoses *(For more details on differential diagnosis of non-osteoarthritis symptoms in the history and physical examination, refer to Appendix C: Alternate Diagnosis and Overall Assessment)*

### EMERGENCY CONDITIONS – URGENT REFERRAL TO SPECIALIST OR ER
- Infection
- Fracture

### URGENT CONDITIONS - URGENT REFERRAL
- Malignancy
- Rheumatoid arthritis

### DIFFERENTIAL DIAGNOSIS THAT MAY MIMIC OA
- Inflammatory arthropathies
- Crystal arthropathies (gout or pseudogout)
- Bursitis (e.g. Trochanteric, Pes Anserine)
- Soft tissue pain syndromes
- Referred pain
- Medical conditions presenting with arthropathy (e.g. neurologic, metabolic, etc.)

D. Investigations *(For more details see Appendix D: Investigations)*
- Blood tests do not diagnose OA. Blood tests may help rule out other conditions and monitor medications. Order tests when history and physical findings indicate a possible alternative diagnosis.
- X-rays are indicated for diagnostic clarification or in anticipation of orthopaedic referral. Indicate that the x-rays are for OA. For knees, x-rays must include standing AP, lateral, and skyline. For hip, specify OA hip series including lateral view of the affected hip and upper 1/3 of femur.
E. Clinical Impression and Factors to Consider Prior to Treatment and Management (Refer to Appendix C: Alternate Diagnosis and Overall Assessment.)

- Rule out alternate diagnosis
  - If the diagnosis is unclear, a Rheumatology assessment can assist with
    - Ruling out non-OA conditions or arthritic mimics
    - Diagnostic arthrocentesis
- Severity of condition (pain and function)
- Impact on independence in society
- Patient goals, expectations, preferences, past treatments
- Self-management needs/modifiable factors (e.g. assistance with weight management strategies, education about pain management, exercise, etc.)
- Psychosocial issues such as: pain amplification, depression, cognition, adherence to treatment, social support

**Recommendation 2** Consider the four pillars of treatment: patient education, rehabilitation, medications and referrals (surgical and non-surgical)

Treatment of OA as a chronic disease is most effective using a multidisciplinary approach and multimodal treatments. An OA Follow-Up Patient Assessment Form is available in Appendix E.

**Step 1: Patient Education**
- Explain the nature of OA as a chronic disease process. Refer patient to education and treatment resources including:
  - The Arthritis Society (toll free Arthritis Answers Line 1800 321-1433 or Web site: www.arthritis.ca)
  - OASIS, Vancouver Coastal Health OsteoArthritis Service Integration System (Web site: www.vch.ca/oasis)
  - Arthritis Consumer Experts (Web site www.arthritisconsumerexperts.org)
  - CAPA, Canadian Arthritis Patient Alliance (Web site www.arthritis.ca/capa)
- Emphasize the importance of appropriate exercise, joint protection, strengthening of muscles supporting the joint with activity modification.
- Emphasize the importance of developing skills to self-manage the condition (refer to attached A Guide for People Living with Osteoarthritis and patient resources). Also, consider a prescription for exercise which specifies the number of minutes per week for each of the following exercises: walking, range of motion, strengthening and, if available, aquatic exercises. Ask the person to keep an exercise diary.
- Address specific issues e.g. social and financial support, nutrition and weight management programs, pain and stress management. Refer to Overweight, Obesity and Physical Inactivity guideline at www.BCGuidelines.ca
- Awareness of private and community programs e.g. The Arthritis Society (toll free Arthritis Answers Line 1-800-321-1433 or web site www.arthritis.ca) or The Arthritis Resource Guide for BC (Web site www.argbc.ca)

**Step 2: Rehabilitation**
- Therapeutic exercise (range of motion, strengthening and aerobic activity).
- Generally, a sign that the patient has done too much exercise is increased pain in the joint lasting longer than 2 hours after exercise.
- Refer to physiotherapy for assessment and specific exercise recommendations if needed
- Recommend supportive footwear with shock absorption such as high-quality, well-fitted shoes and add orthotics if needed.
- One of the most cost-effective treatments for OA of the hip and knee is a cane of appropriate height used in the hand of the opposite side.
- Assistive devices include splints, gait or mobility aids, braces, home and work adaptations. Consider referral to Occupational Therapist, Podiatrists, Orthotists, etc. as needed and available.
- Posture and positioning recommendations for daytime or sleep.

**Step 3: Medications** *(See Osteoarthritis (OA) Medications Table enclosure for more details)*
- Provide education on role of medications (options, risk factors, side effects, complications, cost)
- Begin with monotherapy prn and add/substitute medications depending on response and side effects

### MILD OR MODERATE SYMPTOMS

- Acetaminophen up to 4 grams per day is the first line medication. Consider lowering dose where there is liver disease, alcohol abuse, and for the elderly.
- NSAIDs/Cox-2 inhibitors. Match adverse effects with patient history. Avoid long term daily NSAID use.
- Joint aspiration and/or hyaluronic acid injections.

### SEVERE SYMPTOMS

- Evidence of progressive bone loss
- Advanced loss of joint space in association with moderate to severe pain
- Evidence of increasing acetabular protrusion or femoral head collapse in the hip

**Note: Gastrointestinal Issues with oral NSAIDs**
- There is no evidence that NSAIDs alter the natural course of arthritis. The patient should be made aware that NSAIDs represent symptomatic therapy, and that the therapy is associated with some risks.\(^6\)
- Review risk factors in Appendix B: History (long term use, older age, poor health, past history of ulcers or bleeding disorders, and more than 3 alcoholic drinks per day. Consider current medications (anticoagulants, other NSAIDs and oral steroids).\(^4,5\)
- Choose an NSAID appropriate to the patient based on cardiovascular risk factors. Note that COX-2 inhibitors also carry a GI risk.
- When an NSAID is essential for control of symptoms, prescribe the safest NSAID in the lowest effective dose for the shortest period of time.\(^7\)
- Gastroprotection does not eliminate risk of ulcers, particularly for patients with high GI risk.\(^5\) Gastroprotection will likely reduce symptoms of dyspepsia.
- When there are risk factors, prescribe NSAIDs only for short term use along with gastroprotection: misoprostol, double dose H2 blockers and PPI have been shown to reduce the incidence of GI events.\(^5\)
- Inform patient that GI bleeds can occur with or without warning symptoms. Patients should be informed to stop taking the medications and be reassessed if they have the following symptoms: stomach pain, heartburn, blood in vomit or stools.
- If the patient is experiencing GI problems, refer to guideline: *Dyspepsia – Clinical Approach to Adult Patients* available at www.BCGuidelines.ca
- Avoid long-term daily NSAID therapy.\(^7\)
**Note: Cardiovascular risk and NSAIDS**

“Health Canada acknowledges the panel’s view that, as a group, selective COX-2 inhibitors are associated with an increased risk of cardiovascular events, a risk that is similar to those associated with most NSAIDs [“The cardiovascular safety concerns associated with the traditional NSAIDs are not extended to aspirin”]. The panel noted that this risk is present for all patients taking anti-inflammatory agents and that it increases with longer-term use and when other risk factors, such as cardiovascular disease, are present.”

**Step 4: Referrals (Surgical and Non-Surgical)**

Note urgency on referral: mild, moderate or severe

**Indications for Non-Surgical Referral:**
- Refer to Rheumatology or appropriate Internal Medicine specialist for: red flag conditions (alternative diagnosis), unexpected/unalusual disease progression or complications.
- Refer to PT or OT for: education on self-management or on the disease process; specific exercises for range of motion, strengthening, or joint protection; gait training; knee bracing; pain management education and techniques; mobility aids; and education for dealing with functional difficulties (home, work or leisure).
- Refer to Dietitian for education on weight management.
- If the patient has significant disease progression but is not a surgical candidate, for example because of significant co-morbidities, consider referral to OT for assistance with activities of daily living (ADLs).

**Indications for Surgical Referral**

The indications for arthroscopic knee surgery in patients with OA are similar to patients without arthritis. Arthroscopic debridement has not been shown to have any significant benefit for OA of undiscriminated cause. 10-11

<table>
<thead>
<tr>
<th>FAILURE OF A NON-OPERATIVE PROGRAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Inadequate pain control</td>
</tr>
<tr>
<td>• Increasing need for narcotic medications</td>
</tr>
</tbody>
</table>

**INCREASING FUNCTIONAL RESTRICTIONS**

| • Inability to walk without significant pain |
| • Significantly modified ADLs: i.e. putting on shoes, climbing stairs, squatting and bending | • Increasing threat to patient’s ability to work or live independently |

**SIGNIFICANT ABNORMAL FINDINGS ON EXAMINATION**

| • Of the knee                  |
| • Progressing deformity, especially when valgus >15°or varus >5° |
| • Loss of extension by 10°-15° |
| • Loss of flexion to less than 110° | • Of the hip                  |
| • Decreasing range of motion. Internal rotation of less than 5° measured in flexion |
| • Notable leg length discrepancy |

**PROGRESSION OF DISEASE ON X-RAY (WEIGHT-BEARING FOR KNEE)**

| • Evidence of progressive bone loss |
| • Advanced loss of joint space in association with moderate to severe pain | • Evidence of increasing acetabular protrusion or femoral head collapse in the hip |

A Rheumatologist involved in the care of difficult cases may provide assistance with the timing of referral for surgical assessment.
RECOMMENDATION 3  

Follow-up (Consider using a form to monitor disease progress such as provided in Appendix E: Follow-Up Patient Assessment Form.)

1. Review changes in pain, function and comorbidities.
   Refer to Recommendation 1, Section A and/or Appendix A: Patient History.

2. Review physical findings for red flag issues.
   Further information is found in Recommendation 1, Section C and/or Appendix C: Physical Examination.

3. Review effectiveness of patient education and self-directed treatment plans

   Step 1: Self-Directed Programs (questions on disease process, particularly importance of self-management, weight loss, and joint protection)

   Step 2: Rehabilitation Needs (home and/or community exercise programs, physical therapy for ROM and strengthening, medical devices, orthotics, cane, walker, raised seats, devices, and/or scooter)

   Step 3: Medications: for more details refer to Appendix D: Investigations and Osteoarthritis (OA) Medications Table enclosure

   **Medications for Mild OA**
   - Occasional prn use of acetaminophen up to 1 gram 4 times per day and add prn NSAIDs if necessary
   - If the person is on self-directed care and is doing well, then do routine follow-up unless there is a significant change in pain or function

   **Medications for Moderate OA**
   - For symptomatic OA, prescribe full dose acetaminophen (1 g 4 x day).
   - Within 30 days, do a baseline haemoglobin, blood pressure, AST or ALT, and creatinine if further therapy is contemplated.
   - If regular dosing of acetaminophen at 4 g/day or with NSAIDs, follow-up every 3-12 months depending on comorbidities and severity
   - Consider lowering dose where there is liver disease, alcohol abuse, and for the elderly
   - If the patient is using diclofenac, consider rare development of hepatitis
   - Consider risks and benefits of gastroprotection. Refer to GI Issues with oral NSAIDs note in Recommendation 2: Step 3 – Medications

   **Medications for Severe OA**
   - Same as for moderate OA but review more frequently (every 1-6 months) with a view to surgical referral
   - If there is an increase in severity, i.e. treatment is no longer efficacious or new symptoms, then revisit more often

   Step 4: Investigations
   - For monitoring liver and renal function and other possible side effects of medications (haemoglobin, blood pressure, AST or ALT, and creatinine tests). For more details refer to Appendix D: Investigations, and Osteoarthritis (OA) Medications Table enclosure
Step 5: Assess Need for Non-Surgical and Surgical Referrals. Details are given in Recommendation 2: Referrals.

**Coordination of Care**

Treatment is multi-disciplinary involving regular follow-up. The four pillars of treatment are: patient education and self-management, rehabilitation and physical activity, medications, and referrals, as well as consideration of other supports. As with all chronic diseases, optimal outcome is achieved through a multi-disciplinary approach coordinated by the family doctor.

**Rationale**

Osteoarthritis (OA) was identified by the BC Ministry of Health Services, BC General Practice Services Committee (GPSC), BC Health Authorities and other stakeholders as one of the top ten chronic diseases for which the greatest opportunities exist to improve the quality of the services delivered and the outcomes for patients. OA is the most common type of arthritis and affects about 10% of the population.

Helping patients to maintain a healthy and active lifestyle is an important goal. Timely physical therapy, appropriate exercise training and patient education can affect one’s ability to work and remain active. Maintaining function may reduce the long-term damage to ligaments and joints. Lack of physical activity can potentially lead to a multitude of chronic illnesses including obesity, hypertension, and depression. Treatment for the symptoms (including self management and exercise) should be encouraged. As well, risks and benefits of non-steroidal anti-inflammatory drugs (NSAIDS) should be discussed with the patient. When other treatments are no longer effective, total hip and knee replacements can be a cost-effective means of improving quality of life.

Disclaimer

The principles of the Guidelines and Protocols Advisory Committee are to:
• encourage appropriate responses to common medical situations
• recommend actions that are sufficient and efficient, neither excessive nor deficient
• permit exceptions when justified by clinical circumstances.

The Clinical Practice Guidelines (the “Guidelines”) have been developed by the Guidelines and Protocols Advisory Committee on behalf of the Medical Services Commission. The Guidelines are intended to give an understanding of a clinical problem, and outline one or more preferred approaches to the investigation and management of the problem. The Guidelines are not intended as a substitute for the advice or professional judgment of a health care professional, nor are they intended to be the only approach to the management of clinical problems.

The side-effects listed below apply to NSAID class of drugs:
- GI ulceration, perforation with or without bleeding
- Severe diarrhea
- Hepatotoxicity
- Renal impairment
- Cardiovascular events
- CHF; angina; hypertension; arrhythmia; bronchospasm; pulmonary edema
- Blood dyscrasias
- Thrombocytopenia
- Erythema multiforme
- Symptoms of aseptic meningitis
- Blurred or diminished vision
- Fluid retention
- Peptic ulcer, with/without bleeding; fatalities in the elderly

*Requires the use of a Controlled Prescription Program Form (formerly triplicate prescription program). Special Authority criteria and forms are available on the PharmaCare Web site at http://www.health.gov.bc.ca/pharme/sa/criteria/formsindex.html

**Note: Cardiovascular risk and NSAIDS**

*Health Canada acknowledges the panel’s view that, as a group, selective COX-2 inhibitors are associated with an increased risk of cardiovascular events, a risk that is similar to those associated with most NSAIDs [The cardiovascular safety concerns associated with the traditional NSAIDs are not extended to aspirin*]. The panel noted that this risk is present for all patients taking anti-inflammatory agents and that it increases with longer-term use and when other risk factors, such as cardiovascular disease, are present.*

PAIN AND FUNCTION

Mobility can be assessed using the Timed Up & Go test.† The patient is timed to rise from an arm chair (using usual footwear and walking aids), walk three metres, turn, walk back and sit. Normal time is between 7-10 seconds. Further assessment is suggested for those who take longer time or are unsteady.

† American Geriatric Society. The Timed Up & Go Test for Fall Risk Assessment 2001,49(5):666

| Progression? | Yes | No |

**Physical Exam Summary (abnormal findings):**

| Mild | Moderate | Severe |
## ALTERNATE DIAGNOSIS

Consider alternate diagnosis of non-osteoarthritis symptoms for history and physical examination (amplification of condition)

### Red flag indications

- Acute severe pain
- Fever, night sweats or significant weight loss
- Neurogenic pain pattern
- Significant trauma (e.g. fracture)
- Focal or diffuse muscle weakness
- Claudication pain pattern
- Night pain
- Hot and swollen joint *(not OA)*

### Red flag condition suspected

- Infective arthritis
  - Bacterial
  - Tuberculosis
- Inflammatory arthritis*
  - Reactive
  - Rheumatoid*
- Connective tissue disease
  - SLE
  - Scleroderma
- Other medical conditions presenting with pain
  - Polymyalgia rheumatica
  - Sarcoidosis
  - Thyroid disease
  - Fracture
  - Infective endocarditis
  - Referred pain (i.e. pain originating in the back masquerading as hip pain or hip pain radiating to the knee)
  - Hemochromatosis
  - Diabetic cheiroarthropathy
  - Paraneoplastic syndromes
  - Multiple myeloma

### Consider other issues:

- Fear/avoidance behaviour
- Passive attitude to rehabilitation
- Substance overuse/abuse
- Pain amplification
- Impaired sleep because of pain
- Depression
- Over-protective partner-spouse
- Lack of social/financial support
- Poor adherence to exercise

*Review guideline: Rheumatoid Arthritis – Diagnosis and Management at www.BCGuidelines.ca

## OVERALL ASSESSMENT

If osteoarthritis is suspected, an overall assessment of the condition is important. Ask what problems the patient is having and how much it impacts their life. Consider the following criteria:

<table>
<thead>
<tr>
<th>FEATURE</th>
<th>NONE</th>
<th>MILD</th>
<th>MODERATE</th>
<th>SEVERE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pain</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Overall function</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abnormal findings on physical exam</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ability to function at work</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ability to enjoy recreational activities</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

What are the modifiable factors? From this overall impression, anticipate the nature of treatment:

- Likely satisfactory/sufficient response to non-pharmacologic and/or pharmacologic treatment
  - Yes
  - No
- Referral for non-surgical specialist assessment indicated
  - Yes
  - No
- Referral for surgical assessment indicated
  - Yes
  - No
There are no blood tests to diagnose osteoarthritis. Blood tests are done to rule out other conditions and monitor the disease and/or medications. Order tests when history and physical findings indicate and consider inflammatory versus non-inflammatory presentations (non-OA or OA respectively).

### INVESTIGATIONS TO CONSIDER OF OTHER CONDITIONS SUSPECTED

<table>
<thead>
<tr>
<th>Blood work</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Hematology profile</td>
<td>Test for chronic or inflammatory condition (baseline to monitor NSAID treatment).</td>
</tr>
<tr>

</tr>
<tr>
<td>Microscopy</td>
<td></td>
</tr>
</tbody>
</table>

### DIAGNOSTIC IMAGING

X-rays are indicated for persistent unexplained joint pain or in anticipation of orthopaedic/rheumatologic referral. Specify the x-rays are for OA.

- **knees** – must include standing AP, lateral and skyline.
- **hips** – specify OA hip series including lateral view of the affected hip and upper 1/3 of femur.
## OSTEOARTHRITIS – PATIENT ASSESSMENT FOLLOW-UP

Urgent? | yes | no |
What is Osteoarthritis?

Osteoarthritis (OA) is the most common type of arthritis. It can happen in any joint but is most often in the hands, hips, knees and spine. In osteoarthritis, there is a breakdown of the cartilage on the ends of bones. Healthy cartilage is firm, rubbery and smooth. It acts as a shock absorber. The slippery surface of cartilage allows joints to glide easily. Usually in early OA there is no swelling. Later, bits of cartilage may break off and disturb other tissue in the joint. This can cause pain and swelling. Over time, the bones can change, creating bumps, called spurs. The cartilage may wear away completely and bones may rub together.

What causes Osteoarthritis?

Researchers are studying how the cartilage breaks down. They have found some enzymes that damage cartilage. These enzymes can occur with extra stress in the joint. Factors that increase your chance of getting OA include:

- Previous injury to the joint
- Repeated stress on the joint, such as heavy physical activity or being overweight
- Heredity, and
- Getting older.

What can I do about Osteoarthritis?

Learn about OA. Become skilled at setting goals and solving problems. These skills help you apply the things you learn. A self-management program, such as Arthritis Self-Management Program (ASMP) from The Arthritis Society is a good place to start. If not available or convenient, try other group or home-based programs for relaxation, weight control, and balancing exercise with rest to improve your comfort and function.

Regular exercise helps reduce pain and improve function because:

- strong muscles help protect painful joints, help maintain balance and prevent falls;
- joint movement helps nourish the cartilage;
- flexible muscles allow the body to use less painful positions; and
- fitness exercises help maintain body weight, reduce stress, improve sleep and reduce fatigue.

Consider walking, swimming, Pilates and Tai Chi.

Generally, a sign that you’ve done too much exercise is increased pain in the joint lasting longer than two hours after the exercise has ended. Next time do a bit less. If you have difficulty exercising, you may need advice from a physical therapist.
An occupational therapist can advise you how to reduce stress to your joints while continuing your daily activities. This may include advice about:

- Methods to make daily tasks easier including tools such as jar openers;
- Proper posture, sleeping positions, and work station set up;
- Proper footwear and orthotics supports;
- Splints or braces to protect joints, and
- Getting a better sleep including mattresses, pillows and relaxation.

There are many medications available including creams and gels, acetaminophen (such as Tylenol®), non-steroidal anti-inflammatory drugs (NSAIDs) and injections. All medications have possible side effects whether taken alone or with herbal or over-the-counter medication. Your doctor will help you find a medication to reduce your pain with minimal risks. Your pharmacist can also help with medication questions. Your doctor may recommend surgery if the joint is significantly damaged or if your pain is not well controlled. Surgery for OA can include removing torn cartilage from the joint, realigning bones around the knee or replacing the joint with an artificial joint.

What happens in hip osteoarthritis?

When a hip joint gets osteoarthritis (OA) the joint becomes painful and stiff and muscles become weak. When the hip is stiff, the lumbar spine (lower back) moves more. When hip muscles are too weak to keep the pelvis level during walking, the body may sway sideways with each step. These changes can increase low back discomfort. Keeping the hip joint flexible and strong helps balance forces in the joint, and nourishes the cartilage. It also helps reduce strain in other joints.

Common features of hip OA are:

- Pain and stiffness at the front of the hip or groin;
- Rotation stiffness that causes the toe to point outwards;
- Weakness of muscles which pull the leg out and keep the pelvis level;
- Weakness of the buttock muscles which pull the leg back, and
- Belly muscles too weak to stabilize the lower back.

What can I do about hip osteoarthritis?

Learn as much as you can about OA. Read *A Guide for People Living with Osteoarthritis* including the list of places to get more information.

- Maintain a healthy weight. When you walk fast or on stairs, the forces in your hip are seven times your body weight. Losing ten pounds means 70 pounds less pressure during those activities.
- A cane used in the opposite hand lowers hip pressures.
- Wear shoes that cushion and support. Consider custom insoles.
- Maintain aerobic fitness by walking, bicycling or swimming.
- **Try the exercises on the back of this page. Start gently and increase slowly.** If they don’t help, or if they increase pain, ask your doctor to recommend a physiotherapist (PT). A PT assessment will identify where you are tight, which muscles are weak, how your body compensates and what causes pain. A personal exercise program can be created for you.
- If exercise causes more joint pain for over two hours, do less next time.
To strengthen, hold about 3 seconds and repeat 10 – 15 times. (3-4 times/week)

1. **Strengthen belly muscles**
   Lie on your back with knees bent and feet flat. Tighten lower belly muscles by pulling your belly button down to your spine. Breath normally.

2. **Strengthen hip muscles at back**
   Lie on your back with knees bent, feet flat and belly tight. Squeeze buttocks and lift hips off bed. If this is too easy, try it one leg at a time.

3. **Strengthen hip muscles at side**
   Lie on your side with lower leg bent and top leg in line with your body. Lift the top leg without rolling your pelvis. Don’t lift leg high, just level.

Hold stretches for 20 seconds. Repeat 2 – 3 times. (daily)

4. **Stretch the front of your hip**
   Stand against a wall at an edge or doorway, so half your body leans against the wall. Tighten your belly muscles. Step back with the free leg just far enough to feel a stretch at the front of your hip. Keep your body touching the wall.

5. **Stretch hip rotation**
   Lie on your back. Slowly roll both knees and thighs inward, toward each other keeping knees straight. Return to starting position.

For advice about planning an exercise program, see *The Arthritis Helpbook* by Lorig and Fries, available at libraries, bookstores and The Arthritis Society.

Content prepared by Mary Pack, Arthritis Program, Vancouver Coastal Health. Illustrations prepared for BCMA© by Meike Boer Design
What happens in knee osteoarthritis?

Osteoarthritis (OA) is a disease of the cartilage. When a knee joint gets OA it feels stiff, sore and weak. Knee cartilage can have a healthy response to exercise. Forces in the knee joint influence the risk of osteoarthritis. Too much force can damage the cartilage and increase the risk of getting OA. This can happen if a joint is injured, or if a person is overweight. People with chronic knee pain are more likely to develop OA if their knee muscles are weak and the joint is stiff. Exercise is important to keep the muscles strong, the joint flexible and the cartilage nourished.

Common features of knee OA are:
- weakness when getting up from a chair;
- pain when going up or down stairs; and
- stiffness when trying to bend or straighten the knee.

What can I do about knee osteoarthritis?

Learn as much as you can about OA. Start by reading A Guide for People Living with Osteoarthritis including the list of places to get more information.

- Maintain a healthy weight. If you are heavy, each pound of weight you lose can result in 4 pounds less force in your knee at each step.
- Keep your thigh muscles strong and your knee flexible so it bends and straightens all the way. Good balance is important too.
- Wear good shoes that absorb shock and have firm support around heels. Consider orthotics in shoes and a knee brace if pain continues.
- Avoid sitting on low chairs. You can protect a knee by using a raised toilet seat and a cane. Consider avoiding stairs.
- Maintain aerobic fitness by walking, bicycling or swimming.

Try the exercises on the back of this page. Start gently. Increase slowly.
- If exercise causes more joint pain for over 2 hours, do less next time.
- If these exercises do not help or if they increase your pain, ask your doctor to recommend a physiotherapist (PT). A PT assessment will identify where you are tight, which muscles are weak, how your body compensates and what causes pain. A personal exercise program can then be created for you.
To strengthen, hold about 3 seconds and repeat 10 – 15 times. (3-4 times/week)

1. **Strengthen knee flexors - standing**
   Stand on one leg while holding onto a firm object for support. Keep your body upright and abdomen tucked in. Bend the opposite knee, pulling your foot toward your buttock as far as possible. If this is easy you can put a small weight on your ankle or wear a heavy shoe.

2. **Strengthen thigh muscles**
   Stand with your back against a wall. Feet are shoulder width apart and about 6 inches from the wall. Keep your abdominals tight and slide down the wall until your knees are about 30 – 45 degrees. Only go as far as you can feeling safe and without pain. A rolled towel between your knees helps alignment. Some people may need additional support – such as a nearby countertop to assist in returning to standing.

Hold stretches for 20 seconds. Repeat 2 –3 times. (daily)

3. **Stretch knee & gently tighten thigh**
   Lie on your back with your legs straight. Pull your toes up towards you and push the back of your knee down into the bed or floor. When the back of your knee is pushed into the bed or floor your heel should be able to rise a bit.

4. **Stretch Hamstring muscles**
   Sit on the edge of a chair, with one leg out straight and your foot on a low stool or thick book. Pull toes up and keep the low back straight. Slowly bend forward from your hips without twisting your pelvis. You should feel the stretch at the back of your leg and knee.

For advice about planning an exercise program, see *The Arthritis Helpbook* by Lorig and Fries, available at libraries, bookstores and The Arthritis Society.

What happens when osteoarthritis is in the hand?

Osteoarthritis (OA) is a disease of the cartilage. Without healthy cartilage, pressure is put on bones. Ligaments across joints may stretch. The finger joints may have periodic, painful swollen cysts. Eventually bone spurs or nodes grow around the joint and it may become crooked and stiff. OA in the hand usually affects the two sets of joints that are closest to the fingertips. The base of the thumb, near the wrist, is a common place for OA. Wrist OA may occur after injuries to the wrist.

Common features of hand OA are:

- finger joints get bigger, these are nodes or bone spurs;
- pain or aching at rest or when holding things;
- stiffness in the fingertips causing difficulty making a fist; and
- stiffness of the thumb so it is difficult to hold a large glass or bottle.

What can I do about Hand Osteoarthritis?

Learn as much as you can about OA. Read A Guide for People Living with Osteoarthritis including the list of places to get more information.

- Exercise your hands to stretch tight joints and to keep the cartilage healthy. Exercising in warm water may help stiffness and pain.
- Protect joints by using jar openers, key holders and large handled tools. Avoid extreme or prolonged positions and repetitive activities.
- Consider splints for your thumb or wrist.
- Try the exercises on the back of this page. Start gently. Increase slowly. If they don’t help, or if they increase pain, ask your doctor about a Certified Hand Therapist, Occupational Therapist (OT) or Physiotherapist (PT). These specialists will assess you, teach you a personal exercise program and give advice about joint protection.
- If exercise causes more joint pain for over 2 hours, do less next time.
1. **Stretch your fingers**
   Gently curl the tips of your fingers down to touch the base of each finger, then the middle of the palm then open to the straight position. Do this in a sink of warm water.

2. **Stretch your thumb**
   Touch the tip of your thumb to the tip of each finger, making a circle (not a “D”). Open your hand completely after each touch.

3. **Stretch your wrist**
   Put your palms together with your fingertips near your chin. Slowly lower your hands towards your waist, by moving your elbows apart. Keep your palms together to stretch the wrist. Watch yourself in a mirror to see if both hands are equal.

---

**Protect your joints**

A good, stable thumb position

An unstable thumb position to avoid

A good thumb splint

It’s good to use large handles

Complementary therapies are activities or supplements that are added to or used as an alternative to medical care. Generally, they have not been validated by quality scientific research so the risks and any benefits are not clear. The use of complementary therapy is not endorsed. This guide is provided for your information. It is a guide about questions to ask and precautions to take if you are considering the use of a complementary therapy.

Complementary therapies include a wide range of treatments such as:
- dietary changes;
- vitamins, minerals, herbal supplements, etc.;
- techniques such as relaxation, visualization, meditation; and
- magnets, massage, therapeutic touch, etc.

What should I consider before starting?
Before starting, make sure that you are already eating healthy food, exercising regularly and following the advice of your health care providers. Nutrients from food sources are absorbed best so improve your diet before adding dietary supplements.

1. Have a specific goal when trying a new therapy.
   - Know the specific action and benefit you are trying to achieve and the timeline.

2. Do your research first.
   a. Use reliable Internet resources, such as university, government or non-profit agency websites (e.g. The Arthritis Society).
   b. Use reliable books or written publications/journals.
   c. Ask questions.
      - Is the evidence offered convincing to the general scientific/medical community? If not, why not?
      - How much, how often and how long is necessary to get benefit?
      - How much will the consultations, procedures, and supplements cost?
      - Does it interact with other medications/supplements or therapies?
      - What are the possible risks and side effects?
      - Will it interfere with other medical conditions?
      - Is this therapy accepted by the broad medical community?
3. **Inform your health care providers.**
   a. Begin by discussing options with your doctor, nurse, pharmacist, physiotherapist, etc.
   b. Tell your health care providers about all complementary therapies you are using.
   c. Provide a list of all current medications, supplements and therapies that you are taking or are not taking that were prescribed.
   d. Inform your health care provider of any prescribed therapies you are not using.

4. **Use only health products that have proper certification.**
   Products with a DIN (Drug Identification Number) have been supported by good-quality studies for safety and effectiveness. Products with a NPN (Natural Health Product Number), USP number (US Pharmacopeia), or Consumers Lab logo, or NSF™ international certification may ensure quality but do not ensure effectiveness.

5. **Take the same precaution you would with conventional medicine.**
   Supplements should be treated as drugs. They may have side effects.

6. **Try only one new therapy at a time and assess benefit.**
   Continue the therapy only if it works, with no side effects, and is affordable.

7. **Before surgery, stop dietary/herbal supplements for several weeks.**
   Many supplements have biological effects (such as increased bleeding) that interact with medicines used during or after the operation. Provide a list of all current medications, supplements and therapies to your health care providers.

### Osteoarthritis in Peripheral Joints – Diagnosis and Treatment

#### SUMMARY OF GUIDELINE

**Effective Date:** September 15, 2008

**For full Guideline please go to website:** [http://www.BCGuidelines.ca](http://www.BCGuidelines.ca)

### DIAGNOSIS

- OA is a clinical diagnosis
- Early diagnosis is important for modifiable factors (weight loss, exercise programs and self-management)
- Consider history, physical exam, exclusion of other diagnoses and impact of disease

### INVESTIGATIONS

- No test is reliable for diagnosis
- When x-rays are necessary, specify they are for OA*
- X-rays may indicate OA, but may not relate to symptoms
- Lab tests do not diagnose OA and are used mainly to monitor medications
- X-rays are generally not useful except for alternate diagnosis or orthopaedic referral
- Joint aspirations may be used to rule out other conditions

### MANAGEMENT

**Patient education**

- Explain OA as a chronic disease process
- Encourage self management & provide resources
- Encourage weight loss and diet plan if needed

**Rehabilitation**

- Recommend exercise programs (ROM, strengthening & aerobic) with joint protection
- Recommend assistive devices when needed

**Medications**

- There is no evidence that NSAIDs alter the natural course of arthritis. They provide symptom relief but are associated with some risks (GI & CV). Avoid long-term daily NSAID therapy
- Begin with monotherapy PRN and add/substitute medications depending on response and side effects
- Mild or moderate symptoms:
  - Acetaminophen max 4 g/day (lower dose where there is liver disease, alcohol abuse and for the elderly)
  - NSAIDS/Cox-2 inhibitors. Match adverse effects with patient history. Avoid long term daily use
  - Consider risks and benefits of gastroprotection
  - Joint aspiration and/or hyaluronic acid injections
  - Topicals (capsaicin or NSAIDs)
- Severe symptoms:
  - Use combination therapy as above and reassess
  - Intra-articular corticosteroid injections
  - In complex or difficult cases, consider referral to a rheumatologist for assistance with medication and analgesia titration, complex aspiration/injection procedures, and/or corticosteroid or hyaluronic acid injections

**Indications for Referral:**

- Internist or Rheumatologist – for red flag conditions, complex/difficult cases, complications
- PT – for assessment and specific exercise recommendations
- OT– for assistive devices and home or work adaptations
- Dietician – for weight management
- Orthopaedic Surgeon – failure of non-operative program, increasing function restrictions, significant abnormal findings on exam, progression of disease on x-ray, considering use of opiates & intra-articular injections. The indications for arthroscopic knee surgery in patients with OA are similar to patients without arthritis.

**Follow-up regularly and coordinate care**

* Indicate that the x-rays are for OA – For knees they must include standing AP, lateral, and skyline. For hip, specify OA hip series including lateral view of the affected hip and upper 1/3 of femur.
### Osteoarthritis (OA) Medications Table

**Effective Date:** September 15, 2008

This Medication Table pertains to the Guideline *Osteoarthritis in Peripheral Joints – Diagnosis and Management*  
www.BCGuidelines.ca

Regularly review current listings of Health Canada advisories, warnings and recalls at:
