Palliative Care for the Patient with Incurable Cancer or Advanced Disease
Part 2: Pain and Symptom Management

Effective Date: February 22, 2017

Scope

This guideline presents strategies for the assessment and management of cancer pain, and symptoms associated with advanced disease, in patients ≥ 19 years of age. Part 2 is divided into seven sections, providing recommendations for evidence-based symptom management with algorithms to facilitate quick access to the information required. Hyperlinked notes in the algorithm refer back to more detailed information within each symptom section.

Key symptom areas addressed are:

- **Constipation:** Guideline | Medication Table
- **Delirium:** Guideline | Medication Table
- **Depression:** Guideline | Medication Table
- **Dyspnea:** Guideline | Medication Table
- **Fatigue and Weakness:** Guideline | Medication Table
- **Nausea and Vomiting:** Guideline | Medication Table
- **Pain:** Guideline | Equianalgesic Conversion for Morphine | Medication Table

For additional guidance on palliative pain and symptom management, see also the *BC Inter-professional Palliative Symptom Management Guidelines* produced by the BC Centre for Palliative Care, available at: www.bc-cpc.ca/cpc/symptom-management-guidelines/

The inter-professional guidelines cover the following symptoms:

- Pain
- Fatigue
- Pruritus
- Severe bleeding
- Constipation
- Nausea and vomiting
- Dysphagia
- Anorexia
- Dehydration
- Respiratory congestion
- Dyspnea
- Cough
- Hiccoughs
- Twitching / myoclonus / seizures
- Delirium
Part 2: Pain and Symptom Management

Constipation

Effective Date: February 22, 2017

Key Recommendations

- Prevent constipation by ordering a bowel protocol when regular opioid medication is prescribed.

Assessment

1. Understand the patient’s bowel habits, both current and when previously well (e.g., frequency of bowel movements (BMs), stool size, consistency, and ease of evacuation). Consider using the bowel performance scale available at: http://www.bccancer.bc.ca/family-oncology-network-site/Documents/BPSConstipationScale.pdf
2. The goal is to restore a patient’s normal BM frequency, consistency, and ease of passage.
3. For lower performance status patients (e.g., reduced food intake and activity), lower BM frequency is acceptable as long as there is no associated discomfort.

Management

1. There are many etiologies (e.g., reduced food/fluid/mobility and adverse effects of medications).
2. Exclude impaction when a patient presents already constipated. Abdominal x-ray can be useful when physical examination is inconclusive.
3. Minimize/avoid rectal interventions (enemas, suppositories, manual evacuation), except in crisis management. Note that rectal interventions are contraindicated when there is potential for serious infection (neutropenia) or bleeding (thrombocytopenia), or when there is rectal/anal disease.
4. When risk factors are ongoing, as they are in most cancer patients, suggest laxatives regularly versus prn. Adjust dose individually. Laxatives are most effective when taken via escalating dose according to response, termed “bowel protocol”.
5. Sennosides (e.g., Senokot®) are the first choice of laxative for prevention and treatment. Patients with irritable bowel syndrome may experience painful cramps with stimulant laxatives and often prefer osmotic laxatives such as lactulose or polyethylene glycol (PEG). There is weak evidence that lactulose and sennosides are equally effective;1 however lactulose can taste unpleasant and cause bloating.
6. If rectal measures are required, generally a stimulant suppository is tried first, then an enema as the next option.
7. The BC Palliative Care Drug Plan covers laxatives written on a prescription for eligible patients.
8. For patients with opioid-induced constipation, after a trial of first-line recommended stimulant laxatives and osmotic laxatives, methylnaltrexone (or nalaxegol) may be helpful. Cancer, GI malignancy, GI ulcer, Ogilvie’s syndrome and concomitant use of certain medications (e.g., NSAIDs, steroids and bevacizumab) may increase the risk of GI perforation in patients receiving methylnaltrexone. [Health Canada MedEffect Notice: http://www.healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2010/14087a-eng.php]

1 BCGuidelines.ca: Palliative Care for the Patient with Incurable Cancer or Advanced Disease Part 2: Pain and Symptom Management – Constipation (2017)
Constipation Management Algorithm

Hyperlinks indicate additional information available in guideline sections above:
A = Assessment
M = Management

Assessment (A1)
• Normal bowel habit
• Current bowel performance (A3)
  o Stool frequency
  o Stool consistency
  o Ease of evacuation

Obstructed bowel?
No

Constipation?
No

Osmotic Laxative (M4+5)
  • Lactulose or sorbitol
  • Polyethylene glycol
  • Escalating doses until satisfactory BM

Sennosides-based Protocol (M4+5)
  • Escalating doses until satisfactory BM
  • Maximum senna dose 36 mg tid
  • Add rectal measures at any time if indicated and no contraindications (M3)

Assess cause

Hypomobility (e.g., ascites, autonomic neuropathy, abdominal cancer)

Consider prokinetic agent (e.g., domperidone, metoclopramide)

Add or switch to osmotic laxative

Rectal Measures (M3)
  • Manual disimpaction (if indicated)
  • Glycerin supp
  • Bisacodyl supp
  • Microlax enema
  • Fleet enema*
  • Warm water enema
  • Oil enema

Followed by Sennosides-based Protocol

Opioid-induced (M9)

Consider switching to less constipating opioid (e.g., fentanyl)

Add or switch to osmotic laxative

Consider methylnaltrexone (or naloxegol)

No success

Prevention needed

Irritable bowel syndrome?
No

Constipation?
Yes

1. Rectum empty; OR
2. Contraindications to rectal intervention:
   • neutropenia (WBC <0.5) OR
   • thrombocytopenia (Plt <20)

TREATMENT needed (M2)

Palliative Care Consult

*Contraindicated in patients with renal failure.

Part 2: Pain and Symptom Management

Delirium Management

Effective Date: February 22, 2017

Key Recommendations

- Look for and treat reversible causes of delirium.
- Utilize neuroleptics first line for pharmacological treatment.

Definition

Delirium is a state of mental confusion that develops quickly, usually fluctuates in intensity, and results in reduced awareness of and responsiveness to the environment. It may manifest as disorientation, incoherence, and memory disturbance.

Assessment

1. Delirium may be hypoactive, hyperactive or mixed.
2. Look for underlying reversible cause (refer to Fraser Health Authority, Hospice Palliative Care Symptom Guidelines - Delirium/Restlessness at www.fraserhealth.ca/media/07FHSymptomGuidelinesDelirium.pdf)
3. Ascertain stage of illness and whether delirium is likely to be reversible, or terminal and irreversible.
4. Review advanced care plan and discuss goals of care with substitute decision maker.
5. Refer patient/family to Home and Community Care (see Associated Document: Resource Guide for Practitioners) or timely access to caregiver support and access to respite and/or hospice care.

Management

1. Treat reversible causes if consistent with goals of care.
3. Avoid use of antipsychotics in patients diagnosed with Parkinson's disease or Lewy Body Dementia.
Delirium Management Algorithm

**Hyperlinks indicate additional information available in guideline sections above:**
A = Assessment  
M = Management

**Assessment (A1-3)**
- Level of consciousness  
- Presence of hallucinations  
- Fluctuation of mental confusion

**Diagnosis**

**Depression***
- Treat as appropriate  
- Refer to Palliative Care Part 2 – Depression Management Algorithm

**Delirium***
- Non-Pharmacological Interventions
  - Environment  
  - Lighting  
  - Safety
- Assess and treat all reversible causes (M1)
  - Full physical exam  
  - History  
  - Medication review  
  - Investigations as appropriate

**Pharmacological Treatments**

**Hypoactive (obtunded) patient**
- **AVOID** sedatives  
- Haloperidol: minimum effective dose to control hallucinations

**Hyperactive (agitated) patient**
- **Antipsychotic (M3)**
  - Start with least sedating and work upwards until agitation controlled
    - haloperidol  
    - risperidone  
    - loxapine  
    - olanzapine  
    - quetiapine  
    - methotrimeprazine
  - **AVOID** benzodiazepines  
  - Reassess frequently

**Hyperactive (agitated) patient and compromised patient or staff safety**
- Sedate with benzodiazepine (M2) temporarily in addition to:
  - antipsychotic treatment **AND**  
  - Palliative Care Consult

**Palliative Care Consult**
- Contact local specialist or call hotline: 1-877-711-5757

**Delirium not reversible**
- **Palliative sedation therapy**
  - Reassess frequently

*For clinical features of dementia, depression and delirium, refer to BC Guidelines.ca – Cognitive Impairment – Recognition, Diagnosis and Management in Primary Care

**BCGuidelines.ca: Palliative Care for the Patient with Incurable Cancer or Advanced Disease**

BCGuidelines.ca: Palliative Care for the Patient with Incurable Cancer or Advanced Disease
Part 2: Pain and Symptom Management

Depression

Effective Date: February 22, 2017

Key Recommendations

• Before diagnosing and treating major depressive disorder, first effectively treat pain and other symptoms, then differentiate the symptoms of depression from normal grieving.
• When prescribing antidepressants for this group of patients, select antidepressants with the least drug interactions.

Assessment

1. Depression occurs in 13–26% of patients with terminal illness,¹,² can amplify pain and other symptoms, and is often recognized too late in a patient’s life.
2. Patients are at high risk of suicide and have an increased desire for hastened death.³
3. A useful depression screening question is, “Have you been depressed most of the time for the past two weeks?”⁴
4. A diagnosis of depression in the terminally ill may be made when at least two weeks of depressed mood is accompanied by symptoms of hopelessness, helplessness, worthlessness, guilt, lack of reactivity, or suicidal ideation.
5. DSM-IV criteria for depression are not very helpful because vegetative symptoms like anorexia, weight loss, fatigue, insomnia, and impaired concentration may accompany end stage progressive illness.
6. Risk factors for depression include:
   • personal or family history of depression;
   • social isolation, concurrent illnesses (e.g., COPD, CHF);
   • alcohol or substance abuse;
   • poorly controlled pain;
   • advanced stage of illness;
   • certain cancers (head and neck, pancreas, primary or metastatic brain cancers);
   • chemotherapy agents (vincristine, vinblastine, asparagines, intrathecal methotrexate, interferon, interleukin);
   • corticosteroids (especially after withdrawal); and
   • abrupt onset of menopause (e.g., withdrawal of hormone replacement therapy, use of tamoxifen).

Management

1. Non-pharmacological treatments are the mainstay of treatment for the symptom of depression without a diagnosis of primary affective disorder.
2. Treatment of pain and other reversible physical symptoms should occur before initiating antidepressant medication.
3. If a diagnosis of primary affective disorder is uncertain in a depressed patient, consider psychiatric referral and a trial of antidepressant medication (refer to Appendix A: Medications Used in Palliative Care for Depression). Consider drug interactions, adverse side effect profiles, and beneficial side effects when choosing an antidepressant.
4. In the terminally ill, start with half the usual recommended starting dose of antidepressant.⁵
5. First line therapy is with a selective serotonin reuptake inhibitor (SSRI),² selective serotonin norepinephrine reuptake inhibitor (SSNRI), or noradrenergic and specific serotonergic antidepressant (NaSSA).
6. Tricyclic antidepressants (especially nortryptiline and desipramine) can be considered due to their co-analgesic benefit for neuropathic pain (refer to Appendix A – Medications Used in Palliative Care for Depression). Avoid with constipation, urinary retention, dry mouth, orthostatic hypotension, or cardiac conduction delays.

7. When anticipated survival time is short, consider psychostimulants due to their more immediate onset of effect, but avoid them in the presence of agitation, confusion, insomnia, anxiety, paranoia, or cardiac comorbidity.

8. If life expectancy is 1–3 months, start a psychostimulant and an antidepressant together and then withdraw the stimulant while titrating the antidepressant upwards.
Depression Management Algorithm

Hyperlinks indicate additional information available in guideline sections above:
A = Assessment
M = Management

Depression screening question
“Have you been depressed most of the time for the past two weeks?”

Assess if depression (A1)
- Hopelessness
- Worthlessness
- Lack of reactivity
- Guilt
- Suicidal ideation (A2)

Review risk factors for depression (A6)

Vegetative symptoms
Due to progressive life-limiting illness (A5)
- Insomnia
- Anorexia
- Weight loss
- Fatigue
- Impaired concentration

Depression (A4)

Assess for and manage pain and other symptoms
Palliative Care Consult for refractory symptoms

Non-Pharmacological Treatment for Depression (M1)
- Exercise, rest, nutrition, social and spiritual support
- Psychotherapy
- Cognitive Behavioural Therapy

Pharmacological Treatment for Depression (M2)

< 1 month
> 3 months
1–3 months

Life expectancy

Psychostimulant (M7)

⁸ Special authority required to obtain coverage for modafinil for patients with narcolepsy
Part 2: Pain and Symptom Management

Dyspnea

Effective Date: February 22, 2017

**Key Recommendations**

- Use opioids first line for pharmacological management of dyspnea for patients with incurable cancer.
- Use of opioids in the non-cancer population for breathlessness, especially those with chronic obstructive pulmonary disease (COPD), needs extreme caution and probable consultation with a Palliative Care Physician.

**Definition**

Dyspnea is breathing discomfort that varies in intensity but may not be associated with hypoxemia, tachypnea, or orthopnea. It occurs in up to 80% of patients with advanced cancer.¹

**Assessment**

- Investigations and imaging should be guided by stage, prognosis, and whether results will change management.
- Ask the patient to describe dyspnea severity using a 1–10 scale.
- Identify underlying cause(s) and treat as appropriate.²
- History and physical exam lead to accurate diagnosis in two-thirds of cases.³
- Investigations: CBC/diff, electrolytes, creatinine, oximetry +/- ABGs and pulmonary function, ECG, BNP when indicated.
- Imaging: Chest x-ray and CT scan chest, when indicated.

**Management**

1. Proven therapy includes opioids for relief of dyspnea. For non-cancer patients with breathlessness, especially those with COPD, use of opioids requires extreme caution and consultation with a Palliative Care Physician should be considered.⁴
2. Oxygen is only beneficial for relief of hypoxemia.⁵
3. Adequate control of dyspnea relieves suffering and improves a patient’s quality of life.⁶
4. Treat reversible causes where possible and desirable, according to goals of care.
5. Always utilize non-pharmacological treatment: education and comfort measures.
### Pharmacological Treatment

Opioids, +/- benzodiazepines or neuroleptics, +/- steroids.

<table>
<thead>
<tr>
<th>Drug</th>
<th>Comments</th>
</tr>
</thead>
</table>
| **1. Opioids** *(drugs of first choice)* | • If opioid naive, start with morphine 2.5-5 mg PO (SC dose is half the PO dose) q4h or equianalgesic dose of hydromorphone or oxycodone.  
  • Breakthrough should be half of the q4h dose ordered q1h prn.  
  • If opioid tolerant, increase current dose by 25–50%.  
  • When initiating, start an antiemetic (metoclopramide) and bowel protocol.  
  • Therapeutic doses used to treat dyspnea do not decrease oxygen saturation or cause differences in respiratory rate or CO₂ levels.³  
  • Nebulized forms have NOT been shown to be superior to oral opioids and are not recommended.⁷ |
| **2. Benzodiazepines**      | • Prescribe prn for anxiety and respiratory “panic attacks”.  
  • Lorazepam 0.5-2 mg SL q2-4h prn.  
  • Consider SC midazolam in rare cases.                                                                                                           |
| **3. Neuroleptics**         | • Methotrimeprazine 2.5-5 mg PO/SC q8h, then titrate to effect.                                                                                                                                          |
| **4. Corticosteroids**      | • Dexamethasone 8-24 mg PO/SC/IV qam depending on severity and cause of dyspnea.  
  • Particularly for bronchial obstruction, lymphangitic, carcinomatosis, and SVC syndrome; also for bronchospasm, radiation pneumonitis and idiopathic interstitial pulmonary fibrosis. |
| **5. Supplemental Oxygen**  | • Indicated only for hypoxia (insufficient evidence of benefit otherwise).⁶                                                                                                                                    |
Dyspnea Management Algorithm

Hyperlinks indicate additional information available in guideline sections above:
A = Assessment
M = Management
P = Pharmacological Treatment

Dyspnea screen
(0–10 scale)

Assessment
• History
• Physical assessment
• Laboratory investigation (A4)
• Imaging (A5)

Identify and treat reversible causes

Treat hypoxemia with supplemental oxygen (M2)
(if present)

Treat symptoms of dyspnea

Comfort measures (M5)
1. Air flow (fan) / environment
2. Positioning
3. Loose clothing
4. Relaxation
5. Modify lifestyle

Pharmacological Treatments

Baseline dyspnea
Opioid (P1)
+/- Neuroleptic (P3)
+/- Steroid (P4)
+/- Benzodiazepine (P2) (for anxiety)

Incident dyspnea
Timed opioid (PO/SC/SL) (P1)
Neuroleptic (SC) (P3)

Crisis dyspnea
Opioid (IV/SC) (P1) and Benzodiazepine (IV/SC) (P2)

Refractory dyspnea

Palliative Care Consult

Unremitting dyspnea

Palliative Sedation

Reversible Causes of Dyspnea
Cardiovascular
• Anemia
• Arrhythmia
• Heart failure
• Deconditioning
• Myocardial ischemia
• Pericardial effusion
• Pulmonary emboli

Respiratory
• Bronchial obstruction
• Bronchospasm/asthma
• COPD/emphysema
• Infection
• Interstitial Fibrosis
• Lymphangitic carcinomatosis
• Pleural effusion
• Radiation pneumonitis

Other
• Anxiety/panic disorder
• Ascites
• Cachexia
• Neuromuscular disease

Education (patient and caregiver)
• Breath control
• Energy conservation
• Use of breakthrough medications
• Proper inhaler technique

Advice for Patient

1. Air flow (fan) / environment
2. Positioning
3. Loose clothing
4. Relaxation
5. Modify lifestyle

* Not an exhaustive list. Other opioids may be appropriate.
* For opioid-tolerant patients, increase current dose by 25-50%.
* PharmaCare coverage as of October 2016 (subject to revision). Obtain current coverage, eligibility, and coverage information from the online BC PharmaCare Formulary Search page at pharmacareformularysearch.gov.bc.ca
* Cost as of October 2016 and does not include retail markups or pharmacy fees. Generic and brand name cost separated as indicated by (G).
* This route of administration is used in practice, but not approved for marketing for this indication by Health Canada
Part 2: Pain and Symptom Management

Fatigue and Weakness

Effective Date: February 22, 2017

Key Recommendations

- Except when a patient is dying, recognize that fatigue is a treatable symptom with a major impact on quality of life.

Definition

Fatigue is a subjective perception/experience related to disease, emotional state and/or treatment. Fatigue is a multidimensional symptom involving physical, emotional, social and spiritual well-being and affecting quality of life.¹

Assessment

1. Assess whether symptom is fatigue or weakness (generalized or localized).
2. Distinguish fatigue from depression.

Management

1. After treating reversible causes and providing non-pharmacological treatment recommendations, consider pharmacological treatment (refer to Appendix A: Medications Used in Palliative Care for Fatigue), if consistent with patient’s goals of care.
Fatigue and Weakness Management Algorithm

Hyperlinks indicate additional information available in guideline sections above:
A = Assessment
M = Management

Muscle Weakness (A1)
Localized Weakness
- Cerebral metastases
- Cerebral vascular accident
- Radiculopathy

Generalized Weakness
- Deconditioning
- Paraneoplastic syndrome
- Polymyalgia
- Polymyositis
- Steroid induced myopathy
- Steroid withdrawal, abrupt

Reversible Causes of Fatigue (A3)
- Anemia
- Dehydration
- Hypokalemia
- Hyponatremia
- Hypomagnesemia
- Hypo/hypercalcemia
- Hypothyroidism
- Medication induced
- Alcohol/drug abuse
- Infection
- Sleep disorder
- Obstructive sleep apnea
- Chronic fatigue syndrome

Distinguish fatigue from depression
See BCGuidelines.ca – Palliative Care Part 2 – Depression Management Algorithm

Fatigue Screen
Numeric Rating Scale
(0–10 scale)

Fatigue Assessment
- History
- Physical Exam
- Labs

Assess for and treat persisting pain, dyspnea, and nausea contributing to fatigue

Assess for other causes of fatigue and treat, if appropriate
- Reversible causes of fatigue
- Depression
- Muscle weakness

Palliative Care Consult for refractory symptoms

Non-pharmacological Treatments
General measures
- Individualized graded exercise program
- Nutrition
- Assessment by Home and Community Care for support in home

Education of patient and caregivers
- Normalize
- Energy conservation
- Sleep hygiene

- Special authority required to obtain coverage for Concerta® for ADHD as second line treatment
- Special authority required to obtain coverage for modafinil for patients with narcolepsy
Part 2: Pain and Symptom Management

Nausea and Vomiting

Key Recommendations

• Select anti-nausea medication based on the etiology of the nausea and vomiting.

Assessment

1. Nausea and vomiting are common, but can be controlled with antiemetics.
2. Identify and discontinue medications that may be the cause.
3. Further assessment may include lab tests and imaging to investigate (e.g., GI tract disturbance, electrolyte/calcium imbalance, intracranial disease, and sepsis).
4. Good symptom control may require rehydration, which can be carried out in the home, hospice, or residential care facility using hypodermoclysis, a simple, safe and effective technique that avoids venous access (refer to Appendix A – Hypodermoclysis Protocol).

Management

1. Non-pharmacological: modifications to diet (e.g., small bland meals) and environment (e.g., control smells and noise), relaxation and good oral hygiene, and acupressure (for chemotherapy-induced acute nausea, but not for delayed symptoms).
2. Pharmacological: match treatment to cause (e.g., if opioid-induced, metoclopramide (sometimes IV or SC initially) and domperidone are most effective). Most drugs are covered by the BC Palliative Care Drug Plan, except olanzapine and ondansetron (refer to Appendix B – Medications Used in Palliative Care for Nausea and Vomiting).
3. Consider pre-emptive use of anti-nauseates in opioid-naive patients.
Nausea and Vomiting Management Algorithm

Hyperlinks indicate additional information available in guideline sections above:
A = Assessment
M = Management

Ongoing Comprehensive Assessment
- History
- Physical examination
- Appropriate investigations (bloodwork and investigations as required) (A3)

Patient and Family Education
- Non-pharmacological measures e.g., environmental modification (consider smells, noise, etc.); good oral hygiene; acupressure; fizzy drinks; visualization, distraction, relaxation
- Consultation with a registered dietitian at www.healthlinkbc.ca/dietitian/
- General supportive measures, e.g., food modification, restricted intake, sips, cool and bland food, avoiding lying flat after eating

Treat Underlying Causes (A4)
e.g., hypercalcemia, urosepsis, constipation, uremia, increased intracranial pressure, bowel obstruction, dehydration, medication adverse effects

Treat Disease-specific Issues
i.e., match medications to etiology (M2+3)

Gastroenterological Distension or lumen compression:
- metoclopramide
- domperidone
- methotrimeprazine
Obstruction
- haloperidol
- octreotide
Opioid-induced
- metoclopramide
- domperidone
- methylnaltrexone
Other vagal stimuli:
- methotrimeprazine
- olanzapine
- prochlorperazine
- ondansetron

Chemical (drugs/toxins)
- aprepitant
- haloperidol
- prochlorperazine
- methotrimeprazine
- ondansetron
- olanzapine
- granisetron

Vestibular & motion-related
- dimenhydrinate
- scopolamine

Central nervous system
- Emotional/anxiety:
  - lorazepam
  - nabilone/sativex™
- Increased ICP:
  - dexamethasone
  - dimenhydrinate

Cause unknown
- haloperidol
- methotrimeprazine
- metoclopramide
- olanzapine
- cannabinoids (nabilone/nabiximols/medicinal cannabis)

Re-evaluate Drug Effect
- Consider increasing dose, trying another drug from the same class, or adding another class of drug.
- Re-evaluate patient’s status and hydration.
Resources

- **Abbreviations**
  - GI: gastrointestinal
  - IV: intravenous
  - N&V: nausea & vomiting
  - SC: subcutaneous

- **Appendices**
  - Appendix A – Hypodermoclysis Protocol
  - Appendix B – Medications Used in Palliative Care for Nausea and Vomiting

For additional guidance on nausea and vomiting, see also the **BC Inter-professional Palliative Symptom Management Guidelines** produced by the BC Centre for Palliative Care, available at: www.bc-cpc.ca/cpc/symptom-management-guidelines/
Appendix A: Hypodermoclysis Protocol

Hypodermoclysis is a simple, safe and effective technique for subcutaneously administering fluids to a patient who requires hydration. It avoids the need for venous access in patients who, at the end of life, often have very poor veins. In the home/hospice/residential care facility settings, it can be carried out without the need for fully IV credentialed nursing staff. Refer to the local Home and Community Care office (refer Associated Document: Resource Guide for Practitioners) for when and how to refer.

There are two critical considerations regarding initiating hypodermoclysis in palliative patients:
1. Objectives and timelines must be clear and agreed upon by the family and caregivers.
2. Will adding fluids to a patient whose organ function is failing precipitate cardiac failure and/or cause or worsen lung secretions?

Procedure:
- A 23-25 gauge butterfly needle is inserted under the skin at a 30–45 degree angle. Ask patients which site is preferred of the following choices:
  - For ambulatory patients, consider using chest (subclavicular area), back (infrascapular area) and upper abdominal wall (avoiding waist).
  - For bed-bound patients, use medial or lateral thighs or upper abdomen.
  - Avoid previously irradiated skin, anterior or lateral thigh if edema is present, abdomen if ascites is present, breast tissue, lateral placement near the shoulder, arms, and perineum/groin.
- The fluids used are commonly normal saline (0.9%), normal saline/dextrose (2/3-1/3) and Ringer’s Lactate. Dextrose cannot be used as a hypodermoclysis solution.
- The infusion rate can be up to 75 ml/hr. Solutions are infused by gravity, i.e., a pump is usually not necessary.
- Some patients may only require 1 litre 3–4 times per week, rather than daily administration. A smaller volume (1 liter per day) is often adequate to maintain hydration in terminally ill patients requiring hydration for symptom control.
- Potassium chloride up to 40 mEq per litre may be added to the solution. Do not mix hypodermoclysis solutions with other medications. If medications are being administered by the SC route, use separate site(s).
- Change the solution bag every 24 hours. Change the tubing every 72 hours. Change the SC site if painful, red, hard or leaking.

Subcutaneous hypodermoclysis sites may last up to seven days. Daily assessment of client condition and insertion site is necessary.
Appendix B: Medications Used in Palliative Care for Nausea and Vomiting

Tailor dose to each patient; those who are elderly, cachectic, debilitated or with renal or hepatic dysfunction may require reduced dosages; consult most current product monograph for this information: [http://www.hc-sc.gc.ca/dhp-mps/prodpharma/databasdon/index-eng.php](http://www.hc-sc.gc.ca/dhp-mps/prodpharma/databasdon/index-eng.php)

Refer to guideline and/or algorithm for recommended order of use.
PharmaCare coverage as of October 2016 (subject to revision). Obtain current coverage, eligibility, and coverage information from the online BC PharmaCare Formulary Search page at pharmacareformularysearch.gov.bc.ca
Cost as of October 2016 and does not include retail markups or pharmacy fees. Generic and brand name cost separated as indicated by (G).
This route of administration commonly used in Palliative Care, but not approved by Health Canada.
This indication (i.e. nausea and vomiting) used in practice, but not approved for marketing by Health Canada.
Dose of 2 patches of scopolamine transdermal patch (applied simultaneously) used in practice, but not approved for marketing by Health Canada.
Part 2: Pain and Symptom Management

Pain Management

Effective Date: February 22, 2017

Key Recommendations

- Follow opioid management principles.
- Utilize adjuvant medication for pain-specific management.

Assessment

- Signs and Symptoms
  Use the OPQRSTUV mnemonic to assess pain:
  
  **Table 1: Pain Assessment using Acronym O,P,Q,R,S,T,U,V**

<p>| | |</p>

- Physical Exam
  Look for signs of tumour progression, trauma, or neuropathic etiology: hypo- or hyperesthesia, allodynia (pain from stimuli not normally painful).

Management

- Continuous pain requires continuous analgesia; prescribe regular dose versus prn.
- Start with regular short-acting opioids and titrate to effective dose over a few days before switching to slow release opioids.
- Once pain control is achieved, long-acting (q12h oral or q3days transdermal) agents are preferred to regular short-acting oral preparations for better compliance and sleep.
- Always provide appropriate breakthrough doses of opioid medication, ~10% of total daily dose dosed q1h prn.
- Incident pain (e.g., provoked by activity) may require up to 20% of the total daily dose, given prior to the precipitating activity.
- Use appropriate adjuvant analgesics at any step (e.g., NSAIDs, corticosteroids).
- Record patient medications consistently.
1. Opioid Selection

<table>
<thead>
<tr>
<th>Issue</th>
<th>Preferred Opioid Medication</th>

</tr>
<tr>
<td>Renal failure</td>
<td>fentanyl transdermal or methadone&lt;sup&gt;a&lt;/sup&gt;</td>
<td>morphine&lt;sup&gt;b&lt;/sup&gt;, codeine, meperidine&lt;sup&gt;c&lt;/sup&gt;</td>
</tr>
<tr>
<td>Compliance and convenience</td>
<td>time release formulations (e.g., morphine, hydromorphone, oxycodone)</td>
<td></td>
</tr>
<tr>
<td>Neuropathic pain</td>
<td>oxycodone or methadone&lt;sup&gt;d&lt;/sup&gt; (anecdotal evidence)</td>
<td></td>
</tr>
<tr>
<td>Opioid naïve</td>
<td>low dose morphine, hydromorphone or oxycodone</td>
<td>fentanyl transdermal patch (risk of delayed absorption and overdose potential), sufentanil</td>
</tr>
<tr>
<td>Injection route (e.g., SC)</td>
<td>morphine, hydromorphone, second line: methadone by buccal or rectal route&lt;sup&gt;e&lt;/sup&gt;</td>
<td>oxycodone (injectable) is not available in Canada</td>
</tr>
<tr>
<td>Patient is at extreme risk of respiratory depression</td>
<td>Buprenorphine transdermal patch&lt;sup&gt;f&lt;/sup&gt;</td>
<td></td>
</tr>
</tbody>
</table>

<sup>a</sup> Fentanyl is primarily (75%) cleared as inactive metabolites by the kidney and methadone is cleared hepatically.

<sup>b</sup> Morphine is the least preferred in renal failure because of renally cleared active metabolites.

<sup>c</sup> Meperidine (Demerol®) should not be used for the treatment of chronic pain.

<sup>d</sup> In 2018, Health Canada removed the requirement for an exemption to the federal restriction on methadone prescribing. The College of Physicians and Surgeons of British Columbia has released appropriate guidance on prescribing methadone, a Methadone for Analgesia Guidelines, and a new Prescribing Methadone practice standard. Physicians are expected to acquire the relevant education and training to prescribe methadone for analgesia. This can be demonstrated through completion of the Canadian Virtual Hospice Methadone for Pain course (methadone4pain.ca) and/or by reading the Methadone for Analgesia guideline.

<sup>e</sup> When changing from oral route to buccal or rectal route, use 1:1 dosing with the oral 10mg/ml concentrated solution, and modify if needed depending on effect. If larger doses are required, a more concentrated solution may be compounded, up to a maximum of 40mg/ml. Island Health hospital pharmacy will concentrate to 50mg/ml.

<sup>f</sup> Not covered by BC Pharmacare.

2. Opioid Switching (“rotation”)

- Switch to another opioid when inadequate analgesia is obtained despite dose-limiting adverse effects (AEs). This allows for clearance of opioid metabolites and possibly more effective opioid receptor agonist profile from the new drug.
- Switch to an equianalgesic dose of the second opioid, bearing in mind that published ratios are only a guide and that reassessment and dose modification are required.
- When switching because of AEs (e.g., delirium or generalized hyperalgesia), determine the equianalgesic dose and reduce this dose by 25%. Observe closely, allowing for onset of the new and wearing-off of the previous drug.
- Refer to Appendix A – Equianalgesic Conversion for Morphine.

---

### 3. Addressing Adverse Effects from Opioids

If the AE is not managed symptomatically and persists for more than one week, switch to another opioid.

<table>
<thead>
<tr>
<th>Adverse Effect</th>
<th>Intervention</th>
</tr>
</thead>
</table>
| Constipation         | • Stepwise escalation of regular oral stimulant or osmotic laxative on opioid initiation.  
                        | • Consider methylnaltrexone* for refractory cases.  
                        | • See Palliative Care Part 2: Pain and Symptom Management – Constipation. |
| Nausea               | • Resolves after ~ 1 week. Consider metoclopramide* first line; avoid dimenhydrinate (Gravol®). |
| Sedation             | • Stimulants may be helpful if sedation persists, e.g., methylphenidate, dextroamphetamine, or modafanil. |
| Myoclonus            | • May respond to benzodiazepines, but may be a sign of opioid toxicity requiring hydration, opioid dose reduction or rotation. |
| Delirium             | • Assess for other causes, e.g., hypercalcemia, UTI. |
| Pruritus, sweating   | • Try opioid rotation. |

### 4. Adjuvant Analgesics

- Select based on type of pain and AE profile. Optimize dosing of one drug before trying another. Discontinue adjuvant drug if ineffective.

### 5. Severe opioid-resistant cancer pain

- Consult a palliative care specialist for advice.

---

* Cancer, GI malignancy, GI ulcer, Ogilvie’s syndrome and concomitant use of certain medications (e.g. NSAIDs, steroids, and bevacizumab) may increase the risk of GI perforation in patients receiving methylnaltrexone. [Health Canada MedEffect Notice: http://www.healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2010/14087a-eng.php]

---

B Initiation of fentanyl in patients who are opioid-naïve is contraindicated at any dose.

C The conversion table is unidirectional only and should ONLY be used to convert adult patients from their current oral or parenteral opioid analgesic to the approximate fentanyl transdermal patch for use in chronic pain.

D Do not convert patients previously on codeine or tramadol to fentanyl transdermal patch due to significant inter-patient variability in metabolism, safety, and effectiveness of these drugs.

E Health Canada recommends that 12 mcg/hr patches be used for dose titration or adjustments, not as the initiating dose.

**Abbreviations:** caps capsules; EC enteric coated; G generics; IM intravenous; Inj injection; IR Immediate Release; IV intravenous; LCA subject to Low Cost Alternative Program; max maximum dose; PO by mouth; PR per rectum; OTC over the counter (non-prescription); RDP subject to reference drug program; SR slow release; SC subcutaneous; supps suppositories (rectal); tabs tablets

<sup>a</sup> Dosage requirements may go beyond range shown in table i.e. there is no maximum dose for opioids, unless limited by side effects or toxicity.

<sup>b</sup> PharmaCare coverage as of October 2016 (subject to revision). Obtain current coverage, eligibility, and coverage information from the online BC PharmaCare Formulary Search page at pharmacareformularysearch.gov.bc.ca

<sup>c</sup> Cost as of October 2016 and does not include retail markups or pharmacy fees. Generic and brand name cost separated as indicated by (G).

<sup>d</sup> M-Eslon capsules may be open and the contents sprinkled over soft food (e.g., pudding or apple sauce)

<sup>e</sup> Sufentanil is a potent opioid; initiation by a primary care provider for opiate naïve patients is not recommended, instead refer for Palliative Care Consult. Sublingual sufentanil may be considered for patients receiving at least 60 mg PO morphine equivalents over the last 7 days. Refer to Fraser health Hospice Palliative Care Program Principles of Opioid Management, http://www.fraserhealth.ca/media/HPC_SymptomGuidelines_Opioid.pdf

<sup>f</sup> This route of administration is used in practice, but not approved for marketing for this indication by Health Canada
