Palliative Care for the Patient with Incurable Cancer or Advanced Disease
Part 3: Grief and Bereavement

Effective Date: February 22, 2017

Scope

This guideline addresses the needs of adult patients with incurable cancer or advanced disease (but can be useful for adults dying of any cause), as well as the needs of their caregivers or family, including children. Information and tools are provided to improve a primary care provider’s comfort and skills in dealing with this type of loss.

Diagnostic Code: 309 (adjustment reaction)

Key Recommendations

- Everyone grieves losses, but it is important to recognize especially vulnerable groups such as the elderly, children, the socially isolated, the mentally ill, the disenfranchised, and culturally diverse groups such as new immigrants and the indigenous community.
- It is not necessary to alter normal grieving, but it is helpful to provide a listening ear, to be supportive, and to provide information.
- Distinguish grief from depression and treat grief-related major depression once you are confident it is pathological.
- In the case of Prolonged Grief Disorder (complicated grief), assess and take note of any risk factors or concerns.
- Primary care providers play a key role in the continued monitoring of patients’ grief responses and may refer the patient to grief counselling and treatment options.

Definitions

Grief and bereavement are distinguished from each other, although bereavement includes many aspects of grief.

Grief: An expected response to loss.

Anticipatory grief: Response to anticipated losses.

Bereavement: The state where, following death, the family creates meaning and sense out of the new reality of life without their loved one/person who died.

Prolonged Grief Disorder (complicated grief): Occurs when there is a debilitating intensity or duration of “normal” grief responses that adversely affect the ability to cope with normal life events.1,2

Background

Grief and bereavement services should be available to all patients and families based on assessed needs. Family physicians often feel unprepared and uncomfortable about knowing how to support those going through intense grief. They may both mourn the death of their patient and the patient's death may also trigger their own past grief. Physicians who find themselves significantly impacted by a patient’s death should consider contacting the Physician Health Program. Refer to Associated Document: Resource Guide for Patients and Caregivers.
Grief

Assessment of Grief

- Consider using the Adult Attitudes to Grief Scale\(^1\) (Appendix A: Adult Attitudes to Grief Scale – Patient Handout, Practitioner Score Sheet, and Protocol for Use). The Adult Attitudes to Grief Scale is a brief, self-reported, evidence-based, practical tool. The questions are designed to promote an understanding of the patient’s grief and vulnerability by identifying grief reactions (controlled or overwhelmed) and coping responses (vulnerable or resilient). By scoring responses to the Adult Attitudes to Grief Scale, practitioners can assess levels of vulnerability, and need for support. A score higher than 23 suggests severe vulnerability and a need for specialized grief support services.

- Be aware of the potential desire for hastened death. If present, assess for suicide risk.

- Focus on personal strengths and coping mechanisms: what has worked in the past?

- Protective factors / resiliency for a patient or caregiver:
  - Has an internalized belief in his / her own ability to cope effectively.
  - Perceives the need for AND is willing to access social support.
  - Is predisposed to a high level of optimism / positive state of mind.
  - Has spiritual / religious beliefs that assist in coping with the death.

All of us grieve differently due to age, gender, personal, religious, and cultural differences. Enquire regarding cultural and individual preferences (refer to Appendix B: Cultural Diversity and Individual Preferences) and be aware of age differences (refer to Appendix C: Children and Death).

Management of Grief

1. Non-pharmacological management

The relationship between the physician and the patient is one of the most potent therapeutic tools for assisting patients who are dealing with grief. Reassurance about the normal pattern of grief and a commitment to supporting the patient in an ongoing way is the mainstay of care. It may involve scheduled follow-up visits as necessary. Within that context, the following aspects of management should be considered (refer to Table 1).

Table 1: Non-pharmaceutical management of grief

<table>
<thead>
<tr>
<th>Acknowledgement of loss(es)</th>
<th>Use whatever words are appropriate in the context of the relationship with the patient and family.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Education</td>
<td>Normalize responses to loss, e.g., “you are not going crazy”. Discus what to expect when grieving.</td>
</tr>
<tr>
<td>Lifestyle management</td>
<td>Explore what is personally helpful to the patient, e.g., rest, exercise, social connections, spiritual support, home support, compassionate care benefits program.</td>
</tr>
<tr>
<td>Resources</td>
<td>Refer to patient handout: Appendix D: The Grief Journey.</td>
</tr>
</tbody>
</table>

2. Pharmacological management

In general, there is a limited place for pharmacological management in normal grief. The physician must be alert to the possibility of underlying disease and incipient pathologic grief and treat accordingly, but it is unwise to interrupt the normal constituents of grief such as depressed mood, anxiety, insomnia and anger.

3. Other support

Other support options are patient and caregiver support groups, online support groups, spiritual care and/or faith based communities, and hospice/palliative care programs, including volunteer support. Refer patients for individual counselling when requested and appropriate. Refer to Associated Document: Resource Guide for Patients and Caregivers.
Bereavement

Bereavement includes the period of adjustment following a person's death and it encompasses many elements of grief, including prolonged grief disorder (complicated grief). Anticipate / screen for prolonged grief disorder (complicated grief) reactions and also consider using Appendix E: Bereavement Risk Assessment Tool to assess risk.

1. Risk factors for Prolonged Grief Disorder (complicated grief):
   - co-morbidities: mental illness; cognitive impairment; substance abuse;
   - concurrent stressors: significant other with life-threatening illness;
   - circumstances around the death: perceived as preventable, sudden, unexpected, violent, traumatic or untimely; suicide; found/saw/identified the body; issues with death notification;
   - lack of supports: social isolation, disenfranchised grief; cultural or language barriers; relationships: anger, ambivalence, resentment, attachment insecurity; high marital dependency;
   - low social support; and
   - being a spouse or parent of the deceased.

2. Assessment of bereavement (Refer to Appendix F: Bereavement Algorithm)
   - The following tools may be useful in support of the ongoing physician patient relationship:
     - Issues with different ages, especially children (refer to Appendix C: Children and Death)
     - Appendix E: Bereavement Risk Assessment Tool
     - Appendix F: Bereavement Algorithm
     - Appendix G: Guide to Bereavement Assessment and Support
     - Appendix H: Caregiver Questionnaire
   - Timing for assessment of caregivers for bereavement/grief
     - 2–8 weeks: assess for grief related depression (refer to Appendix I: Distinguishing Grief and Depression) and other health issues (e.g., sleep, nutrition).
     - 6 months: assess for prolonged grief disorder (complicated grief) if not already identified and treated.

3. Diagnosis of Prolonged Grief Disorder (complicated grief)

4. Criteria for diagnosing Prolonged Grief Disorder (Complicated Grief)
   - Yearning for the deceased must be experienced at least daily over the past month or to a distressing and disruptive degree, (i.e., intense and intrusive thoughts, unusual sleep disturbance, suicidal ideation), and the persistence for at least six months of five of the following nine symptoms:
     - difficulty moving on or reengaging with life;
     - numbness / detachment;
     - excessive bitterness or anger about the death;
     - feeling that life is empty;
     - a sense that the future holds no meaning without the deceased;
     - trouble accepting the death;
     - feeling stunned, dazed, or shocked by the loss;
     - avoiding reminders of the loss; and
     - difficulty trusting others since the loss; social withdrawal.
   - These symptoms can cause marked dysfunction in social, occupational, self-care, or other important domains.
Management of Bereavement (Refer to Appendix F: Bereavement Algorithm)

1. Non-pharmacological management

Table 2: Non-pharmacological management of bereavement

| At time of death (or ASAP there-after) | • Personally contact the bereaved person / family.  
• Acknowledge the death and reactions including feelings such as guilt, relief, or shock.  
• Ascertain and address immediate concerns about care, the death, or the funeral.  
• Arrange for follow-up contact. |
|--------------------------------------|
| After death                          | • Provide information about grief, i.e., what to expect and what is helpful (refer to Appendix D: The Grief Journey (Patient Handout).  
• Provide information about local resources (e.g., bereavement groups, spiritual / religious supports, grief counsellors) and online resources (refer to Associated Document: Resource Guide for Patients and Caregivers).  
• Share Appendix J: Be Gentle with Yourself (Patient Handout). |
| Ongoing care contact                 | • Within 2 weeks, acknowledge, or contact family.  
• Contact again at 1–2 months, 6 months, and 11–12 months (anniversary of the death).  
• Recognize that holidays, birthdays, and wedding anniversaries are tough.  
• Be aware that the second year can also be difficult. |

2. Pharmacological management

85% of grief in bereavement is normal grief, not requiring pharmacological management.6,7

Table 3: Pharmacological management of bereavement

| Benzodiazepines | • Benzodiazepines have a very limited role in the management of acute grief.  
• Refer to sleep hygiene resources. For example, Associated Documents:  
• Melatonin is non-addictive and may be a helpful sleep aid for some patients. Melatonin is prescribed at a wide range of doses (0.1-10 mg at hs). 3-10 mg hs is commonly used in palliative care and geriatric settings. |
|--------------------------------------|
| Treating grief-related major depression: antidepressants | • Treat grief-related major depression once you are confident it is pathological.  
• If depression is suspected while a person is acutely grieving, start by recommending regular exercise, counselling, and supports. If symptoms are worse or not improving by 8 weeks post-death, start antidepressant medication (refer to BCguidelines.ca – Major Depressive Disorder in Adults - Diagnosis and Management). |
| Treating Prolonged Grief Disorder (complicated grief) | • Assess in the context of the person’s life, personality, culture, and the nature of the illness/death.  
• Refer to a bereavement counsellor, psychologist, or psychiatrist who will provide targeted psychotherapy, Complicated Grief Treatment, in addition to possible pharmacologic management. |

Disclaimer

The Clinical Practice Guidelines (the “Guidelines”) have been developed by the Guidelines and Protocols Advisory Committee on behalf of the Medical Services Commission. The Guidelines are intended to give an understanding of a clinical problem, and outline one or more preferred approaches to the investigation and management of the problem. The Guidelines are not intended as a substitute for the advice or professional judgment of a health care professional, nor are they intended to be the only approach to the management of clinical problem. We cannot respond to patients or patient advocates requesting advice on issues related to medical conditions. If you need medical advice, please contact a health care professional.
# Appendix A: Adult Attitude to Grief Scale – Patient Handout

**Adult Attitude to Grief scale**  
Indicate (tick) your response to the attitudes expressed in the following statements:

<table>
<thead>
<tr>
<th>Adult Attitude to Grief scale</th>
<th>Strongly agree</th>
<th>Agree</th>
<th>Neither agree nor disagree</th>
<th>Disagree</th>
<th>Strongly disagree</th>

Vulnerability Score (AAG score) = _______ (total score for the 9 items)
Level of vulnerability identified = _______

Levels of vulnerability identified by the AAG score:
- Severe vulnerability > 24
- High vulnerability 21–23
- Low vulnerability <20

---

Adapted and used with permission from Dr. Linda Machin. © Linda Machin 2010 (*modified 2013) (N.B. resilient scores reversed to permit a simple addition).

Machin L, Bartlam B, Bartlam R. Identifying levels of vulnerability in grief using the Adult Attitude to Grief Scale: from theory to practice. Bereavement Care. 2015 34:2, 59-68.
Using the Adult Attitude to Grief scale (AAG) – a practice protocol (© Linda Machin)

- The AAG can be used as a **standard** form of assessment within a service or used **selectively** i.e. where it is seen to be appropriate (by the practitioner).

- **Information for clients:**
  1. **explain** how the AAG is used in the service/by the practitioner and gain informed consent (see ii, iii, iv below).
  2. **explain the purpose of the scale** i.e. to help client and practitioner have a clear picture of a client’s grief.
  3. **give a copy of the scale to the client;** explain the 5 choices associated with each item on the scale (from strong agreement to strong disagreement) and decide who will read out each statement.
  4. **assure** the client that there are no right or wrong answers.
  5. **when the scale is used - in addition to identifying levels of agreement/disagreement with the 9 items in the scale encourage** the client to say more about each of the 9 statements to increase an understanding of their individual experience and perspective on grief.

- **The Vulnerability Indicator score** is to help the practitioner have an overview of the client’s need for support. It is important **NOT to use a score / numbers sheet with clients** as this can convey a sense of being tested and may prevent honest responses.

- When the AAG has been completed discuss the responses to the scale with the client:
  1. **ask** how the client felt using the scale.
  2. **ask whether there were particular themes in the scale which stood out as being significant or troubling to them.**
  3. **give feedback on any evident bias** i.e. an overview of the tendency towards being overwhelmed, controlled or resilient.
  4. **give more detailed feedback, reflecting on where there seems to be tension/contradictions between the overwhelmed, controlled and resilient responses suggesting possible vulnerability e.g. where the desire to be in control and get on with life is undermined by strong emotions (evident where there is agreement with both item 2 and 8).**

- **Use the evidence from the AAG responses:**
  1. **at an initial assessment to determine what kind of support** service is most appropriate for the client.
  2. **to enable the practitioner and the client, jointly, set goals** for support / intervention.
  3. **as part of the help process, to review** the client’s changing grief reactions and responses.
  4. **as a tool in supervision** i.e. as a guide to determine appropriate and effective therapeutic/support strategies.
  5. **to evaluate the outcome** of the client’s grief at the end of support.

N.B. for correspondence or copies of: the AAG for use with clients; the Vulnerability Indicator score sheets; practice record sheets – contact Dr Linda Machin – l.machin@keele.ac.uk
Appendix B: Cultural Diversity and Individual Preferences

Considerations for cultural and individual patient preferences in grief/bereavement discussions:

- When a patient and physician enter into grief and bereavement discussions, each brings individual cultural backgrounds and values that influence the discussions.
- Although understanding cultural norms is important, physicians must be careful to avoid stereotyping patients based on their cultures.
- An individual's culture is influenced by the culture of the family, religion, spirituality, education, occupation, social class, friends, and personal preferences.
- Asking open-ended questions can elicit a patient's preferences for physician frankness, decision making, and direct versus indirect communication.
- Physicians may prevent misunderstanding and promote trust by respectfully listening to a patient's beliefs and values.
- Assess individual preferences and tailor discussions appropriately.
- Consider a patient's sex, age, health literacy, health status, previous health care experiences, social status, culture, and race/ethnicity.
- Avoid assumptions about what the patient is likely to want and ask directly about values and preferences.

Useful Questions to Help Determine Preferences:

<table>
<thead>
<tr>
<th>Factors</th>
<th>Useful questions</th>
<th>Rationale</th>
</tr>
</thead>
<tbody>
<tr>
<td>Social, educational, and family factors</td>
<td>“Tell me about your family” &lt;br&gt;“Have you or your family had significant experience with someone who has had a serious illness or who has died? If so, how did that experience affect you?”</td>
<td>- The physician may offend or stereotype the patient because of incorrect assumptions if he/she does not ask about the patient’s background. &lt;br&gt;- Misunderstandings between physician and patient may occur if social, educational, and family preferences are not assessed.</td>
</tr>
<tr>
<td>Cultural, religious, and spiritual factors</td>
<td>“Is there anything I should know about your cultural, religious or spiritual views about illness or life and death?”</td>
<td>- The physician may be regarded as disrespectful if the patient’s cultural, religious, and spiritual preferences are not addressed. &lt;br&gt;- The patient may reject medical advice if the physician does not understand how the patient views the physician’s role and advice in the context of culture, religion, or spirituality.</td>
</tr>
</tbody>
</table>

## Appendix C: Children and Death

<table>
<thead>
<tr>
<th>Age</th>
<th>Developmental State/Task</th>
<th>Concept of Death</th>
<th>Grief Response</th>
<th>Signs of Distress</th>
<th>Possible Interventions</th>
</tr>
</thead>
</table>
| 2–4 | • Egocentric: believes world centres around them.  
• Narcissistic: No cognitive understanding.  
• Preconceptual: unable to grasp concepts. | • Seen as abandonment.  
• Seen as reversible, not permanent.  
• Common statements: “Did you know my daddy died – when will he be home?” | • Intensive response, but brief.  
• Very present oriented.  
• Most aware of altered patterns of care. | • Regression: sleeping and eating disorders – bedwetting. | • Short interactions.  
• Frequent repetition.  
• Comforting.  
• Touching. |
| 4–7 | • Gaining sense of autonomy. Exploring world outside of self.  
• Gaining language.  
• Fantasy thinking/wishing. Initiative stage seeing self as initiator.  
• Concerns of guilt. | • Death still seen as reversible.  
• Great personification of death.  
• Feelings of responsibility because of wishes, thoughts.  
• Common statements: “It’s my fault; I was mad at her and wished she’d die.” | • Verbalization.  
• Great concerns with process.  
• How? Why?  
• Repetitive questioning. | • Regression: nightmares, sleeping and eating disturbances, violent play.  
• Attempts to take on role of person who died. | • Symbolic play.  
• Drawing / stories.  
• Allow / encourage expression of energy / feelings about anger.  
• Talk about it. |
| 7–11* | • Concrete – operational.  
• Industry versus inferiority.  
• Beginning of socialization.  
• Development of cognitive ability.  
• Beginning of logical thinking. | • Death as punishment.  
• Fear of bodily harm; mutilation.  
• This is a difficult transition period – still wants to see death as reversible but beginning to see it as final. | • Specific questioning.  
• Desire for complete detail.  
• Concerned with how others are responding.  
• What is the right way?  
• How should they be responding?  
• Starting to have ability to mourn and understand mourning. | • Regression: problems at school, withdrawn from friends.  
• Sleeping and eating disturbances.  
• Overwhelming concern with body.  
• Suicidal thoughts (desire to join the one who died).  
• Role confusion. | • Answer questions.  
• Encourage expression of range of feelings.  
• Encourage/allow control.  
• Be available but allow alone time.  
• Symbolic play.  
• Talk about it. |
| 11–18* | • Formal operation problem solving.  
• Abstract thinking.  
• Integration of one’s own personality. | • “Adult” approach.  
• Ability to abstract.  
• Beginning to truly conceptualize death.  
• Work at making sense of teachings. | • Depression.  
• Denial.  
• Regression: more often willing to talk to people outside of family.  
• Traditional mourning. | • Depression.  
• Anger.  
• Anger towards parents.  
• Non-compliance.  
• Rejection of former teaching.  
• Role confusion.  
• Acting out. | • Encourage verbalization.  
• Do not take control.  
• Encourage self-motivation.  
• Listen.  
• Be available.  
• Do not attempt to take away grief. |

*It is during these 2 age/stages that most children/young adults struggle with their own body image issues, they also seem to struggle the most with changing body images of illness and death. It is important to prepare them in advance about what they may see and then allow them to verbalize their feelings about what they saw.

### Appendix E: Bereavement Risk Assessment Tool

<table>
<thead>
<tr>
<th>Assessment Date</th>
<th>Assessed by</th>
<th>ID#</th>
<th>Patient / Deceased Name</th>
<th>Bereaved Name</th>
<th>Comments</th>
</tr>
</thead>
</table>

#### Risk Indicators and Protective Factors

**I. Kinship**
- a) spouse/partner of patient or deceased
- b) parent/parental figure of patient or deceased

**II. Caregiver**
- a) family member or friend who has taken primary responsibility for care

**III. Mental Health**
- a) significant mental illness (eg major depression, schizophrenia, anxiety disorder)
- b) significant mental disability (eg developmental, dementia, stroke, head injury)

**IV. Coping**
- a) substance abuse / addiction (specify)
- b) considered suicide (no plan, no previous attempt)
- c) has suicide plan and a means to carry it out OR has made previous attempt
- d) self-expressed concerns regarding own coping, now or in future
- e) heightened emotional states (anger, guilt, anxiety) as typical response to stressors
- f) yearning/pining for the deceased OR persistent disturbing thoughts/images > 3 months*
- g) declines available resources or support
- h) inability to experience grief feelings or acknowledge reality of the death > 3 months*

**V. Spirituality / Religion**
- significant challenge to fundamental beliefs / loss of meaning or faith / spiritual distress

**VI. Concurrent Stressors**
- a) two or more competing demands (eg single parenting, work, other caregiving)
- b) insufficient financial, practical or physical resources (eg ↓ income, no childcare, illness)
- c) recent non-death losses (eg divorce, unemployment, moving, retirement)
- d) significant other with life-threatening illness / injury (other than patient/deceased)

**VII. Previous Bereavements**
- a) unresolved previous bereavement(s)
- b) death of other significant person within 1 year (from time of patient’s death)
- c) cumulative grief from > 2 OTHER deaths over past 3 years
- d) death or loss of parent/parental figure during own childhood (less than age 19)

**VIII. Supports & Relationships**
- a) lack of social support/social isolation (perceived or real - eg housebound)
- b) cultural or language barriers to support
- c) longstanding or current discordant relationship(s) within the family
- d) relationship with patient/deceased (eg abuse, dependency)

**IX. Children & Youth**
- a) death of parent, parental figure or sibling*
- b) demonstration of extreme, ongoing behaviours/symptoms (eg sep anxiety+, nightmares)
- c) parent expresses concern regarding his/her ability to support child’s grief
- d) parent/parental figure significantly compromised by his/her own grief

**X. Circumstances Involving the Patient, the Care or the Death**
- a) patient/deceased less than age 35
- b) lack of preparedness for the death (as perceived or demonstrated by bereaved)*
- c) distress witnessing the death OR death perceived as preventable*
- d) violent, traumatic OR unexplained death (eg accident, suicide, unknown cause)*
- e) significant anger with OTHER health care providers (eg “my GP missed the diagnosis”)
- f) significant anger with OUR hospice palliative care program (eg “you killed my wife”)*

**XI. Protective Factors Supporting Positive Bereavement Outcome**
- a) internalized belief in own ability to cope effectively
- b) perceives AND is willing to access strong social support network
- c) predisposed to high level of optimism/positive state of mind
- d) spiritual/religious beliefs that assist in coping with the death*

Appendix F: Bereavement Algorithm

Bereavement

Acute Grief

- Acknowledge loss
- Normalize grief experience
- Offer Resources

2–8 weeks post death ASSESS for grief-related MAJOR DEPRESSION

Yes: DEPRESSION Nonpharmacologic Rx
- Regular exercise
- Counselling
- Provide support
- Regularly reassess

No: No comorbid conditions (75–90%)

6 months post death ASSESS for Prolonged Grief Disorder (complicated grief)

Yes: Prolonged Grief Disorder (complicated grief) (10–15%)
- Psychosocial support
- Combined treatment with targeted psychotherapy and possibly antidepressants
- Adjustment to death and reengaged in relationships and activities

No: Uncomplicated grief (85–90%)

ASSESS If worse or not improving after 8 weeks

Yes: Add Pharmacological Rx refer BCGuidelines.ca – Major Depressive Disorder in Adults – Diagnosis and Management

No: Bereavement

Appendix J: Be Gentle with Yourself (Patient Handout)

Thoughts on Coping with Loss

Grief is a process that takes time, patience, and understanding. There are, however, some things you can do to take some control during this painful time. Your physical health is often the easiest place to begin.

Start by:
- Reducing alcohol, caffeine and sugar intake.
- Drinking enough water each day.
- Eating a healthy diet.
- Getting as much rest as you can.
- Learning to say no to things you don't have energy to do.
- Believing in yourself and your ability to adjust to your loss.
- Participating in some form of physical activity each day.
- Allowing yourself time to mourn.
- Not isolating yourself, i.e., share your pain with a compassionate person or find a counsellor with experience in grief and loss.
- Nurturing yourself, i.e., use art, poetry, meditation, music, journaling, massage, or anything that makes you feel good.
- Talking about your grief, i.e., try to give your sorrow words or write them in a journal. It is healthy to share your memories both happy and sad with people who care.

Additional thoughts

- We have tears for a purpose. Some scientists believe that crying is important to our bodies to relieve the toxins that build up from stress and emotional pain. When we repress our tears it can lead to illness. However it works, experience tells us that crying is healing. If you don't feel comfortable crying in the presence of others, allow time to cry alone. It will relieve the pressure and help you to control your grief in social settings.
- You are the best authority on your grief. Well meaning friends may try to help by keeping you busy or making sure you are never alone. It is important for you to determine for yourself what is best.
- Spend time with people you trust. Try not to isolate yourself with your feelings. Friends who do not judge your behaviour, who allow you to talk about your grief, and who accept your feelings are invaluable.
- Recognize your physical and psychological limitations. Most people experience fatigue during grief. Don't hesitate to excuse yourself from commitments you feel too tired or sad to attend. Avoid situations you believe may cause you stress or anxiety, instead allow time for simple activities that soothe and relax and provide creative outlets of your own choosing. Allow yourself to just ‘be’.
- Use all resources that are available to you. If you have a faith or religion that gives you comfort, this is a time to depend on it. Sharing feelings with others, even strangers, who have had similar experiences can give perspective and assure you that you will survive. Grief counselling in groups or individually can assist you in understanding your grief and help you to cope with its manifestations.

Above all, BE GENTLE WITH YOURSELF
