Problem Drinking Part 1 - Screening and Assessment

Effective Date: April 1, 2011
Revised Date: April 1, 2013

Scope

This guideline provides practitioners with practical information on how to conduct screening for problem drinking in adults aged ≥ 19 years. Approximately 350,000 British Columbians are problem drinkers. This means that in a typical family practice of 1,500 patients, 120-200 patients are at risk for alcohol abuse or dependence. Problem drinking affects the medical management of every chronic medical and mental health condition. Research has shown that many screened patients cut down on their drinking simply because they were asked about their alcohol use, and effective screening for problem drinking can be completed in as little as 5 minutes. Although this document does not deal specifically with teenagers, screening for this age group is also recommended.

The following steps are outlined in this guideline:
- Screening - asking about alcohol use
- Assessment for at-risk drinking, alcohol abuse or dependence

Diagnostic Code
- 303: Alcohol dependence syndrome
- 305: Non dependent use of drugs

Screening and Assessment

Screening identifies patients who need further assessment or treatment by determining their level of risk based on reported alcohol use and other relevant clinical information. Consider the following two screening questions during any patient interaction, when clinical triggers/red flags are observed (see Table 1) and/or when a patient fails to respond to appropriate management (see Screening - Asking About Alcohol Use).

Q1. Do you sometimes drink beer, wine or other alcoholic beverages?
Q2. How many times in the past year have you had:
   - 5 or more drinks in one day (men)?
   - 4 or more drinks in one day (women)?

Practitioners may wish to use the “Alcohol Screening Note” provided with this guideline.

Interventions should be selected based on the assessment completed during the screening. Although alcohol misuse is a spectrum disorder, positive screens will fall into one of three categories:

1. At-risk drinking:
   - Men - 5 or more drinks on one or more days in the last year.
   - Women - 4 or more drinks on one or more days in the last year.

2. Alcohol abuse:
   - Patient meets 1 or more Diagnostic and Statistical Manual of Mental Disorders (DSM) IV criteria for abuse in the last 12 months.

3. Alcohol dependence:
   - Patient meets 3 or more DSM IV criteria for dependence in the last 12 months.

* Significant portions of this guideline were adapted from the National Institute on Alcohol Abuse and Alcoholism (NIAAA), “Helping Patients Who Drink Too Much”, A Clinicians’ Guide, Updated 2005 Edition, and should be fully acknowledged for developing this useful clinical tool. A full copy of their guideline and reference materials can be found on NIAAA’s website at http://pubs.niaaa.nih.gov

http://pubs.niaaa.nih.gov
Table 1: Clinical Triggers / Red Flags

<table>
<thead>
<tr>

<th>Mental</th>
<th>Psychosocial</th>
</tr>
</thead>
<tbody>
<tr>
<td>• MCV &gt; 96</td>
<td>• Cognitive impairment or decline</td>
<td>• Unexplained time off work/loss of employment</td>
</tr>
<tr>
<td>• Elevated GGT, AST, ALT (esp. GGT or AST:ALT &gt; 2:1)</td>
<td>• Mood, anxiety or sleep disorder</td>
<td>• Frequent no show for appointments,</td>
</tr>
<tr>
<td>• GERD, hypertension, diabetes, pancreatitis</td>
<td>• Significant behavioural or academic change</td>
<td>• Poor medication compliance</td>
</tr>
<tr>
<td>• Chronic non-cancer pain</td>
<td></td>
<td>• Significant life event (e.g., divorce, loss of spouse, parent)</td>
</tr>
<tr>
<td>• Alcohol on breath</td>
<td></td>
<td>• Recent or recurrent trauma or domestic violence</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• High-risk behaviours (e.g, problem gambling, DUI, STIs)</td>
</tr>
</tbody>
</table>

Note: Laboratory evaluation, including liver function tests, are not necessary unless clinically indicated and are not sensitive enough to be used alone as screening tests.

Abbreviations: MCV, Mean cell volume; GGT, Gamma-glutamyl transpeptidase; AST, Aspartate aminotransferase; ALT, Alanine transaminase; GERD, Gastroesophageal reflux disease; DUI, Driving under the influence; STI, Sexually transmitted infection

AUDIT, CAGE and CRAFFT Tests

• AUDIT: The Alcohol Use Disorders Identification Test (AUDIT), a 10 item questionnaire, can identify at-risk or problem drinking as well as dependence.³ The test can be used as a re-assessment tool by repeating it at a later time.

• CAGE: The CAGE questionnaire is a less sensitive tool at detecting alcohol abuse. This test can be used in addition to the screening provided in this guideline. However for primary screening it is recommended physicians use the two-question screen first.

• CRAFFT: The CRAFFT screen is specifically designed for use in adolescents.

Screening: Asking About Alcohol Use

Q1: Do you sometimes drink beer, wine or other alcoholic beverages?

Yes → Proceed to Q2

No →

• Why not? (Identify history of of alcohol misuse by person or significant others)
• If no history, screening complete.
• If history presents, document, then ask “How are you doing?”
  (A) If well, offer support statement and review current steps to maintain abstinence;
  (B) If not well, ask why and offer support (inquire when last drink);
  (C) If recently stopped, rescreen in the future.
Q2: How many times in the past year have you had – 5 or more drinks in one day (men)? 4 or more drinks in one day (women)?

See Appendix A for standard drink definition - one standard drink is equivalent to 1 can of 5% beer, a 140ml glass of 12% wine or 1.5 oz "shot" of 40% spirits.

If yes to one or more days of heavy drinking your patient is an **at-risk drinker**.

Ask the following questions to determine the weekly average:

Q3: On average, how many days a week do you have an alcoholic drink? 

Q4: On a typical drinking day, how many drinks do you have? X 

X = weekly average

Next steps:
1) Record heavy drinking days in the past year and the weekly average in the patient’s chart or use alcohol screening notes provided in this guideline
2) Proceed to **Assessment for Alcohol Abuse or Dependence**

No; 0 days

A) State maximum drinking limits
   
   For healthy men up to age 65:
   • no more than 3 drinks in a day AND
   • no more than 15 drinks in a week

   For healthy women (and healthy men over 65):
   • no more than 2 drinks in a day AND
   • no more than 10 drinks in a week

B) Recommend lower limits or abstinence as medically indicated for patients:
   • taking medications that interact with alcohol
   • health condition exacerbated by alcohol
   • pregnancy - advise abstinence from alcohol

C) Express openness to talking about alcohol use and any concerns it may raise

D) Rescreen annually

**Assessment for Alcohol Abuse or Dependence**

**Assessment**

• The following tables provide the DSM IV criteria and sample questions for determining alcohol abuse or dependence.
• Questions correspond with alcohol screening note criteria for abuse or dependence.
• First assess for alcohol abuse, then, if indicated, assess for dependence.

**General questions**

One of the following introductory questions can be used before asking about abuse or dependence:

Q. Has your life ever been affected by alcohol?
Q. Has your spouse or anyone said anything about your drinking?
Q. How long have you been drinking like this?
Questions and Criteria for Assessing Abuse

In the past 12 months, has the patient’s drinking caused or contributed to -

<table>
<thead>
<tr>
<th>Sample questions</th>
<th>No</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1. <strong>Role failure</strong></td>
<td>Q. Have you missed work or class because of your drinking?</td>
<td></td>
</tr>
<tr>
<td>A2. Risk of <strong>bodily harm</strong></td>
<td>Q. Do you sometimes drink and drive?</td>
<td></td>
</tr>
<tr>
<td>A3. Run-ins with the <strong>law</strong> / legal issues</td>
<td>Q. Have you been charged with DUI or been given a roadside suspension?</td>
<td></td>
</tr>
<tr>
<td>A4. <strong>Relationship</strong> trouble</td>
<td>Q. Has your spouse or family complained about your drinking?</td>
<td></td>
</tr>
</tbody>
</table>

**Conclusion** - Yes ≥ 1 --- your patient has alcohol abuse. Proceed to the questions below.

No --- proceed to Part 2 - Brief Intervention for At-Risk Drinking.

Questions and Criteria for Assessing Dependence

In the past 12 months, the patient has -

<table>
<thead>
<tr>
<th>Sample questions</th>
<th>No</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>D1. Increased <strong>tolerance</strong></td>
<td>Q. Do you need to drink more to get the same affect?</td>
<td></td>
</tr>
<tr>
<td>D2. Experienced <strong>withdrawal</strong></td>
<td>Q. When you stop drinking, have you ever experienced physical or emotional withdrawal? Have you had any of the following symptoms: irritability, anxiety, shakes, sweats, nausea, or vomiting?</td>
<td></td>
</tr>
<tr>
<td>D3. Failed to stick to <strong>drinking limits</strong></td>
<td>Q. Do you often drink more than you plan to?</td>
<td></td>
</tr>
<tr>
<td>D4. Failed attempts to <strong>cut down or stop</strong> drinking</td>
<td>Q. Have you ever tried to cut down or stop drinking? How long did that last?</td>
<td></td>
</tr>
<tr>
<td>D5. Spent a lot of <strong>time</strong> on drinking related activities</td>
<td>Q. Do you spend more time thinking about or recovering from alcohol than you used to? Have you ever thought of ways to avoid getting caught?</td>
<td></td>
</tr>
<tr>
<td>D6. Spent less time on <strong>other matters</strong></td>
<td>Q. Have you reduced family or recreational events because of alcohol use in the past year?</td>
<td></td>
</tr>
<tr>
<td>D7. Kept drinking despite psychological or physical problems</td>
<td>Q. Do you think that drinking is causing problems for you? What keeps you drinking?</td>
<td></td>
</tr>
</tbody>
</table>

**Conclusion** - Yes ≥ 3 --- your patient has alcohol dependence. Proceed to Part 2 - Brief Intervention for Alcohol Dependence.

No --- your patient still has alcohol abuse. Proceed to Part 2 - Brief Intervention for Alcohol Abuse.

Rationale

Every health care practitioner will encounter patients with alcohol problems in their practice. It is therefore important that all adolescent and adult patients be screened for problem drinking at some time. In BC as many as one in 10 visits to Vancouver General Hospital Emergency Room was for substance abuse.⁴ As well, the number of patients staying at Vancouver General and University of British Columbia Hospitals due to substance abuse increased by 44% between 2005 and 2008 (from 1,317 to 1,896).⁵ Screening and brief intervention are effective ways to reduce alcohol use as well as reduce acute care utilization. Research shows:

- Screening, Brief Intervention and Referral to Treatment (SBIRT) can cut hospitalization costs by $1,000 per person screened and save $4 for every $1 invested in trauma center and emergency department screening.⁶⁷⁸
Comparing the results of those who received brief counseling with those who did not, researchers found that counseling resulted in a 40 to 50% decrease in alcohol consumption, a 42% drop in emergency room visits, a 55% decline in motor vehicle crashes, and a 100% reduction in arrests for alcohol or other substance violations.²

Research has also shown that many screened patients cut down on their drinking simply because they were asked about their alcohol use; likewise, brief interventions have been shown to effectively reduce alcohol and other drug use.⁹

Note: All of these drinks contain 13.6 grams of alcohol.
Problem Drinking Part 2 - Brief Intervention

Effective Date: April 1, 2011
Revised Date: April 1, 2013

Scope

This guideline provides practitioners with practical information on how to conduct brief intervention for problem drinking in adults aged ≥ years and can be used after a positive screen occurs when using the BC Guideline “Screening for Problem Drinking”.

Once screening is complete and a patient is deemed at-risk, physicians may perform a brief intervention. Problem drinking is a behaviour that can be changed through intervention, and physicians in primary and hospital based care are in a key position to make a difference. A study of two minute brief intervention screenings concluded that “self reported patient status at 6 months indicated significant improvements over baseline for illicit drug use and heavy alcohol use.”

Brief interventions motivate patients to lower their risk for alcohol related problems and are often successful in addressing other medical issues including medication adherence, weight loss, smoking cessation and dietary habits. If your patient is seeing you for another problem, it may be necessary for screening to be done at the first appointment and intervention done at a follow up appointment.

The following steps are outlined in this guideline:

• Brief intervention
• Follow-up and support

Diagnostic Code

303: Alcohol dependence syndrome
305: Non dependent use of drugs

Intervention Selection

Selected interventions should be based on the assessment completed during the screening (See Problem Drinking Part 1 - Screening and Assessment). Although alcohol misuse is a spectrum disorder, positive screens will fall into one of three categories.

1. At-risk drinking: Men - 5 or more drinks on one or more days in the last year. Women - 4 or more drinks on one or more days in the last year.
2. Alcohol abuse: Patient meets 1 or more Diagnostic and Statistical Manual of Mental Disorders (DSM) criteria for abuse in the last 12 months.
3. Alcohol dependence: Patient meets 3 or more DSM IV criteria for dependence in the last 12 months.

Practitioners may wish to use the “Brief Intervention Follow-up Note” provided with this guideline.

* Significant portions of this guideline were adapted from the National Institute on Alcohol Abuse and Alcoholism (NIAAA), ‘Helping Patients Who Drink Too Much’, A Clinicians’ Guide, Updated 2005 Edition, and should be fully acknowledged for developing this useful clinical tool. A full copy of their guideline and reference materials can be found on NIAAA's website at http://pubs.niaaa.nih.gov
First – state your conclusion and recommendations clearly:

1. “You are drinking more than is medically safe. I think your drinking is putting your health at risk and is not good for you.” Relate to patient’s concerns and medical findings (e.g., anxiety, gastroesophageal reflux disease (GERD)).

2. “I strongly recommend that you cut down or quit.”
   (Note: Only about 20% of alcohol dependent drinkers require medically managed withdrawal. See Problem Drinking Part 3 - Office Based Management of Alcohol Withdrawal and Prescribing Medications for Alcohol Dependence.)

Second – gauge readiness to change drinking habits by asking one of the following:

Q: “Are you willing to consider making changes in your drinking?”
Q: “Do you want to do anything about your drinking?”
Q: “How do you feel about my recommendation? Do you have any questions?”
Q: “What do you think? Would that work for you? Does that make sense?”

Is the patient ready to commit to change at this time?

Yes

• Help set a goal
  Cut down to within maximum drinking limits or abstain.

• Agree on a plan
  – specific steps.
  – how drinking will be tracked (e.g., diary, kitchen calendar).
  – how the patient will manage high-risk situations (e.g., social events).
  – who might be willing to help, such as a spouse or non-drinking friends.

• Provide educational materials
  See Resource section in Problem Drinking Part 1 - Screening and Assessment.

No

A. Repeat screen regularly (annually / semi-annually).
B. Link related health concerns to alcohol use.

• Do not be discouraged
  Ambivalence is common. Your advice has likely prompted a change in your patient’s thinking, a positive change in itself. With continued reinforcement, your patient may decide to take action. For now:
  – Restate your concern about his or her health.
  – Encourage reflection: Ask patients to think about it. Assess the major barriers to change.
  – Reaffirm your willingness to help when he or she is ready.
  – Follow-up and support.
Intervention for Alcohol Abuse

Physicians are advised to take the following steps when conducting an intervention:

1. **State your conclusion and recommendation clearly:**
   - “I believe that you have an alcohol use disorder. I strongly recommend that you stop drinking and I’m willing to help.”
   - Relate to the patient’s concerns and medical findings if present.

2. **Negotiate a goal and develop a plan:**
   - Abstaining is the safest course for most patients with alcohol use disorders.
   - Patients who have milder forms of abuse or dependence and are unwilling to abstain may be successful at cutting down.

3. **Consider referring to external or community resources:**
   - Alcohol and drug counselor, addiction medicine physician.
   - Community groups such as Alcoholics Anonymous (AA).
   - See Community Health and Resource Directory (CHARD).

   If patient will not abstain, advise cutting down to established drinking limits. Provide follow-up and support.

Intervention for Alcohol Dependence

For dependence, complete the following in addition to steps 1-3 above:

4. **For patients who have dependence:**
   Monitor for withdrawal - Only about 20% of alcohol dependent drinkers require medically managed withdrawal. Refer to Problem Drinking Part 3 - Office Based Management of Alcohol Withdrawal and Prescribing Medications for Alcohol Dependence.

5. **Prescribing medications for alcohol dependence:**
   Medication, in conjunction with psychosocial interventions, can play a valuable part in the management of alcohol dependence. See Part 3 - Office Based Management of Alcohol Withdrawal and Prescribing Medications for Alcohol Dependence for more information on prescribing medications.

6. **Arrange follow-up:**
   Arrange follow-up appointments, including medication management support if needed. See Problem Drinking Part 3 - Office Based Management of Alcohol Withdrawal and Prescribing Medications for Alcohol Dependence. To support behaviour change, consider seeing patient at least once every 14 days in initial period.

   Advise abstinence with medication support.
Follow-up and Support

**REMININDER:** Document alcohol use and review goals at each visit (use *Brief Intervention Follow-up Note*). If the patient is receiving a medication for alcohol dependence, medication management support should be provided.

**Was the patient able to meet and sustain the reduction plan and goal?**

- **Yes**
  - Congratulate, reinforce and support continued adherence to recommendations.
  - Coordinate care with a specialist if the patient has accepted referral. Communicate with external/community agencies on patient progress.
  - Maintain medications for alcohol dependence for at least 6 months and as clinically indicated thereafter.
  - Continue to address coexisting medical disorders and psychiatric symptoms (e.g., insomnia, anxiety). Pharmacological management of depression and anxiety is more effective for patients that abstain from alcohol.
  - Renegotiate goals.

- **No**
  - Acknowledge that change is difficult.
  - Support efforts to cut down or abstain, while making it clear that your recommendation is to abstain.
  - Relate drinking to patient’s problems (e.g., health, psychological or social) as appropriate.
  - If the following measures aren’t already being taken, consider:
    - Refer or consult with an addiction medicine physician. Recommend external or community resources (AA or Employment Assistance Program).
    - Ask patient to engage significant others.
    - Initiate a medication for alcohol-dependent patients who endorse a goal of abstinence.
    - Refer to community counselor or resource. See CHARD.
  - Continue to address coexisting medical disorders and psychiatric symptoms (e.g., insomnia, anxiety)
    - Pharmacological management of depression and anxiety is less effective while the patient continues to misuse alcohol. Use extreme caution with the prescribing of tricyclic antidepressants.
Rationale

Every health care practitioner will encounter patients with alcohol problems in their practice. It is therefore important that all adolescent and adult patients be screened for problem drinking at some time. In BC as many as one in 10 visits to Vancouver General Hospital Emergency Room was for substance abuse.¹ As well, the number of patients staying at Vancouver General and University of British Columbia Hospitals due to substance abuse increased by 44% between 2005 and 2008 (from 1,317 to 1,896).² Screening and brief intervention are effective ways to reduce alcohol use as well as reduce acute care utilization. Research shows:

- Screening, Brief Intervention and Referral to Treatment (SBIRT) can cut hospitalization costs by $1,000 per person screened and save $4 for every $1 invested in trauma center and emergency department screening.⁹-¹¹
- Comparing the results of those who received brief counseling with those who did not, researchers found that counseling resulted in a 40 to 50% decrease in alcohol consumption, a 42% drop in emergency room visits, a 55% decline in motor vehicle crashes, and a 100% reduction in arrests for alcohol or other substance violations.¹²

Research has also shown that many screened patients cut down on their drinking simply because they were asked about their alcohol use; likewise, brief interventions have been shown to effectively reduce alcohol and other drug use.¹³

Additional plan (withdrawal treatment, coexisting conditions, etc): ____________________________________________________________________________________________
Problem Drinking Part 3 - Office Based Management of Alcohol Withdrawal and Prescribing Medications for Alcohol Dependence

Effective Date: April 1, 2011
Revised Date: April 1, 2013

Scope

This guideline provides practitioners with practical information on how to conduct office based management of withdrawal and medication management for adults aged ≥19 years with alcohol dependence.*

The following are outlined in this guideline:

• Office based management of alcohol withdrawal
• Prescribing medications for alcohol dependence

Diagnostic Code

303: Alcohol dependence syndrome
305: Non dependent use of drugs

Family physicians with a supportive, nonjudgmental, yet assertive attitude can be a great asset in confronting and treating patients with alcohol and other substance abuse problems. With the right attitude and the right tools, primary care physicians can manage most patients through the withdrawal phase of their illness and be a powerful influence in their ongoing struggle for recovery.¹

Section 1 - Office Based Management of Alcohol Withdrawal

Contraindications to Outpatient Withdrawal Management

• History of withdrawal seizure or withdrawal delirium.
• Multiple failed attempts at outpatient withdrawal.
• Unstable associated medical conditions: Coronary Artery Disease (CAD), Insulin-Dependent Diabetes Mellitus (IDDM).
• Unstable psychiatric disorders: psychosis, suicidal ideation, cognitive deficits, delusions or hallucinations.
• Additional sedative dependence syndromes (e.g., benzodiazepines, gamma-hydroxy butyric acid, barbituates and opiates).
• Signs of liver compromise (e.g., jaundice, ascites).
• Failure to respond to medications after 24-48 hours.
• Pregnancy.
• Advanced withdrawal state (e.g., delerium, hallucinations, temperature > 38.5 °).
• Lack of a safe, stable, substance-free setting and care giver to dispense medications.

Benzodiazepines are considered the treatment of choice for the management of alcohol withdrawal symptoms. Benzodiazepines reduce the signs and symptoms of alcohol withdrawal, incidence of delirium, and seizures. Based on indirect comparisons there is currently no strong evidence that particular benzodiazepines are more effective than others and selection should be made on an individual basis.²³ Alprazolam and triazolam are not recommended.

* Significant portions of this guideline were adapted from the National Institute on Alcohol Abuse and Alcoholism (NIAAA), “Helping Patients Who Drink Too Much”, A Clinicians’ Guide, Updated 2005 Edition, and should be fully acknowledged for developing this useful clinical tool. A full copy of their guideline and reference materials can be found on NIAAA's website at http://pubs.niaaa.nih.gov
Diazepam (Valium®) is recommended because of its efficacy profile, wide therapeutic window and “self tapering” effect due to its long half life. Other benzodiazepines can be considered such as clonazepam, lorazepam and oxazepam. In the case of intolerance to benzodiazepines, physicians may wish to consider using a different class of medications (e.g., anticonvulsants). It is recommended that physicians with less experience with diazepam follow the rigid schedule. Physicians with experience using diazepam for alcohol withdrawal can consider front loading. Three medication protocols are provided (see Table 1).

### When Conducting Outpatient Withdrawal, do the following:

- Start on a Monday or Tuesday unless weekend coverage is available.
- See the patient daily for the first three to four days and be available for phone contact.
- Have the patient brought to the office by a reliable family member or caregiver.
- Prescribe thiamine (Vitamin B₁) 100 mg daily for five days.
- Encourage fluids with electrolytes, mild foods and minimal exercise.
- Avoid natural remedies, caffeine or any activity that increases sweating (e.g., hot baths, showers and saunas/sweat lodges).
- Assess vital signs, withdrawal symptoms, hydration, emotional status, orientation, general physical condition and sleep at each visit.
- Encourage patient to call local (including health authority/municipal) Alcohol and Drug or Employee Assistance Programs and attend Alcoholics Anonymous (AA) meeting on day 3.
- Monitor for relapse, explore cause, and correct if possible. If unable to address cause, refer to inpatient detox.

* Pulse rate >100 per minute, diastolic BP > 90 mm Hg or signs of withdrawal.
** Frequently, very little additional medication is necessary after initial loading.

Note: Benzodiazepines should be discontinued after withdrawal symptoms resolved (5-7 days).

### Section 2: Prescribing Medications for Alcohol Dependence

#### Three Medications Are Currently Available:

- **Naltrexone**: Blocks euphoria associated with alcohol use. CONTRAINDIATED in patients taking opiates.
- **Acamprosate**: Reduces chronic withdrawal symptoms.
- **Disulfiram**: Adversive agent, causes nausea, vomiting, dysphoria with alcohol use and requires abstinence and counselling before initiation. Disulfiram should be used with caution.

#### Why Should Medications be Considered for Treating an Alcohol Use Disorder?

Consider pharmacotherapy for all patients with alcohol dependency. Patients who fail to respond to psychosocial approaches and/or addiction counselling are particularly strong candidates. The above medications can be used immediately following withdrawal or any time thereafter; however, these medications should be used in conjunction with addiction counselling and other psychosocial supports.
Must Patients Agree to Abstain?

No matter which alcohol dependence medication is used, patients who have a goal of abstinence, or who can abstain even for a few days prior to starting the medication, are likely to have better outcomes. Still, it is best to determine individual goals with each patient. Some patients may not be willing to endorse abstinence as a goal, especially at first. However, abstinence remains the optimal outcome.

A patient’s willingness to abstain has important implications for the choice of medication. For example, a study of oral naltrexone demonstrated a modest reduction in the risk of heavy drinking in people with mild dependence who chose to cut down rather than abstain.⁴ Acamprosate is approved for use in patients who are abstinent at the start of treatment. Total abstinence is needed with disulfiram. Disulfiram is contraindicated in patients who continue to drink, because a disulfiram-alcohol reaction occurs with any alcohol intake.

Which of the Medications Should be Prescribed?

(see Appendix A: Prescription Medication Table for Alcohol Dependence)

Which medication to use will depend on clinical judgment and patient preference. Each has a different mechanism of action. Some patients may respond better to one type of medication than another.

NALTREXONE

Naltrexone works by blocking the euphoria associated with alcohol use. Its use is CONTRAINDICATED in patients taking opiates. Oral naltrexone is associated with lower percentage drinking days, fewer drinks per drinking day, and longer times to relapse.⁵ ⁶ It is most effective in patients with strong cravings. Efficacy beyond 12 weeks has not been established. Although it is especially helpful for curbing consumption in patients who have drinking “slips” it may also be considered in patients who are motivated, have intense cravings and are not using or going to be using opioids. It appears to be less effective in maintenance of abstinence as meta-analyses have shown variable results. Monitoring of liver enzymes may be required.

ACAMPROSATE

Acamprosate works by reducing chronic withdrawal symptoms. Acamprosate increases the proportion of dependent drinkers who maintain abstinence for several weeks to months, a result demonstrated in multiple European studies and confirmed by a meta-analysis of 17 clinical trials.⁷ However, this has not been demonstrated in patients who have NOT undergone detoxification and NOT achieved alcohol abstinence prior to beginning treatment. Acamprosate should be initiated as soon as possible after detoxification and the recommended duration of treatment is one year. There is currently insufficient evidence to suggest that acamprosate has a therapeutic advantage over naltrexone.

DISULFIRAM

Disulfiram is an adverse agent that causes nausea, vomiting, and dysphoria with alcohol use. Abstinence and counselling are required before initiation of treatment with disulfiram. Data on the effectiveness of disulfiram in alcohol use disorders is mixed. Disulfiram has been shown to have modest effects on maintaining abstinence from alcohol, particularly if it is administered under supervision. It is most effective when given in a monitored fashion, such as in a clinic or by a spouse. Thus the utility and effectiveness of disulfiram may be considered limited because compliance is generally poor when patients are given it to take at their own discretion.⁸ ⁹ Disulfiram may be considered for those patients that can achieve initial abstinence, are committed to maintaining abstinence, can understand the consequences of drinking alcohol while on disulfiram, and can receive adequate ongoing supervision. It may also be used episodically for high-risk situations, such as social occasions where alcohol is present. Daily uninterrupted disulfiram therapy should be continued until full patient recovery, which may require months to years.

How Long Should Medications be Maintained?

The risk for relapse to alcohol dependence is very high in the first 6 to 12 months after initiating abstinence and gradually diminishes over several years. Therefore, a minimum initial period of 6 months of pharmacotherapy is recommended. Although an optimal treatment duration has not been established, treatment can continue for one to two years if the patient responds to medication during this time when the risk of relapse is highest. After patients discontinue medications, they may need to be followed more closely and have pharmacotherapy reinstated if relapse occurs.
If One Medication Does Not Work, Should Another Be Prescribed?

If there is no response to the first medication selected, you may wish to consider a second. This sequential approach appears to be common clinical practice, but currently there are no published studies examining its effectiveness. There is not enough evidence to recommend a specific ordering of medications.

Is There Any Benefit to Combining Medications?

There is no evidence that combining any of the medications to treat alcohol dependence improves outcomes over using any one medication alone.

Should Patients Receiving Medications Also Receive Specialized Alcohol Counselling or a Referral to Mutual Support Groups?

Offering the full range of effective treatments will maximize patient choice and outcomes, since no single approach is universally successful or appealing to patients. Medications for alcohol dependence, professional counselling, and mutual support groups are part of a comprehensive approach. These approaches share the same goal while addressing different aspects of alcohol dependence: neurobiological, psychological, and social. The medications are not prone to abuse, so they do not pose a conflict with other support strategies that emphasize abstinence. Using medications to treat patients does not interfere with counselling or other abstinence based programs such as AA.

Almost all studies of medications for alcohol dependence have included some type of counselling, and it is recommended that all patients taking these medications receive at least brief medical counselling. In a recent large trial, the combination of oral naltrexone and brief medical counselling sessions delivered by a nurse or physician was effective without additional behavioral treatment by a specialist.¹⁰ Patients were also encouraged to attend mutual support groups to increase social encouragement for abstinence.

Rationale

Outpatient alcohol withdrawal is safe and cost effective for the vast majority of problem drinkers.¹¹-¹⁴ Only about 20 per cent of problem drinkers require a hospital based or inpatient setting for alcohol detoxification.¹ Patients are treated earlier in the course of their disease in an office based setting which prevents further complications, and reduces the need for hospitalization. Withdrawal as an outpatient is more effective in reaching certain populations that may not use inpatient detox, such as women, children, youth, older adults, psychiatric populations, human immunodeficiency virus (HIV) affected, and people with other disabilities.

This guideline was developed by the Guidelines and Protocols Advisory Committee, approved by the British Columbia Medical Association, and adopted by the Medical Services Commission.

THE GUIDELINES AND PROTOCOLS ADVISORY COMMITTEE

The principles of the Guidelines and Protocols Advisory Committee are to:

- encourage appropriate responses to common medical situations
- recommend actions that are sufficient and efficient, neither excessive nor deficient
- permit exceptions when justified by clinical circumstances

**PharmaCare Coverage Definitions**

- **G**: generic(s) are available.
- **Regular coverage**: also known as regular benefit; does not require Special Authority; patients may receive full coverage*.
- **Partial coverage**: some types of regular benefits are only partially covered* because they are included in the Low Cost Alternative (LCA) program or Reference Drug Program (RDP) as follows:
  - **LCA**: When multiple medications contain the same active ingredient (usually generic products), patients receive full coverage* for the drug with the lowest average PharmaCare claimed price. The remaining products get partial coverage.
  - **RDP**: When a number of products contain different active ingredients but are in the same therapeutic class, patients receive full coverage* for the drug that is medically effective and the most cost-effective. This drug is designated as the Reference Drug. The remaining products get partial coverage.
- **Special Authority**: requires Special Authority for coverage. Patients may receive full or partial coverage depending on LCA or RDP status. These drugs are not normally regarded as first-line therapies or there are drugs for which a more cost-effective alternative exists.
- **No coverage**: does not fit any of the above categories.

*coverage is subject to drug price limits set by PharmaCare and to the patient’s PharmaCare plan rules and deductibles. See [www.health.gov.bc.ca/pharmacare/](http://www.health.gov.bc.ca/pharmacare/) for further information.
